HIV Disease and Hepatitis C Virus (HCV) Co-Infection – Florida, 2013

STD and Hepatitis Section in collaboration with HIV/AIDS Section – Surveillance Unit
Division of Disease Control and Health Protection

HIV Disease data from 1981 through December 2013
Hepatitis C data from 2003-2013
Data sources: HIV/AIDS Reporting System & MERLIN

Created: 12/21/13
Revision: 09/03/14
HIV/HCV Co-Infection - Florida

• This presentation contains data acquired from matching cases living with HIV disease through 2013 and reported in the HIV/AIDS database (eHARS) WITH the acute and chronic HCV data (confirmed, probable and suspect cases) reported between 2003 – 2013 in the MERLIN database.

• All matched cases and HIV disease cases noting a history of HCV in eHARS were considered co-infected with HIV and HCV and were analyzed further. County data exclude Department of Correction (DOC) cases.
HIV/HCV Co-Infection – Florida (cont)

- Infection with more than one pathogen is called co-infection. When modes of transmission for pathogens are the same or significantly overlap, which can occur with HIV and hepatitis, infection with more than one pathogen is likely.

- Potentially severe concurrent illnesses to HIV infection, like viral hepatitis, may increase mid- to long-range morbidity and mortality. Chronic hepatitis C is common in the HIV-infected population. Infection by hepatitis viruses in HIV-infected patients may impact health status, decrease quality of life and increase health care costs.
Cases Living with HIV Disease

- Data in these slides represent cases living with HIV disease, also referred to as Persons Living with HIV/AIDS (PLWHAs), who were reported through the most recent calendar year. Living data are also referred to as prevalence cases.
- HIV prevalence data are generated later in the year, usually in July, when most of the “expected” death data are complete.
- Adult cases represent ages 13 and older, pediatric cases are those under the age of 13. For data by year, the age is by age of diagnosis. For living data, the age is by current age at the end of the most recent calendar year, regardless of age at diagnosis.
- Unless otherwise noted, whites are non-Hispanic and blacks are non-Hispanic.
- Total statewide data will include Department of Correction (DOC) cases unless otherwise noted. County data will exclude DOC cases.
HIV/HCV Co-Infection – Florida (cont)

• HCV is *more* serious in HIV-infected persons. It leads to liver damage more quickly. Co-infection with HCV may also affect the treatment of HIV infection.

• Therefore, it is important for HIV-infected persons to know whether they are also infected with HCV and, if they aren’t, to take steps to prevent infection.
• Injection drug use is one of the main ways people become infected with HIV and with HCV. In fact, 50%-90% of HIV-infected injection drug users are also co-infected with HCV.

• Persons who received blood products for either hemophilia or a transfusion prior to 1987 are at increased risk of HCV infection.

• Heterosexual sex or perinatal exposure can also transmit HCV infection. However, these risks are much lower for acquiring HCV than for acquiring HIV.
HIV/HCV Co-Infection – Florida (cont)

- Limitations of the data:
  - Documentation of hepatitis C is NOT complete.
  - One-third to one-half of people chronically infected with HCV are unaware of their infection and have not been reported into MERLIN (the reporting system for HCV).
  - Social Security Numbers are usually NOT reported in MERLIN, making it impossible to validate many cases who are reported in both MERLIN and the HIV/AIDS reporting system.

- Therefore, keep in mind that these data represent a minimal estimate of HIV/HCV co-infection in Florida.
HIV/HCV Co-infected Adult Cases, by County of Residence,*
Living and Reported through 2013, Florida

HIV/HCV Co-infected Adult Cases
N=9,312

- 0 Cases
- 1 – 50 Cases
- 51 – 100 Cases
- 101 – 150 Cases
- Over 150 Cases

Note: Of the 102,189 living adult (age 13+) HIV/AIDS Cases in Florida, 9,312 (9.1%) are known to be co-infected with HIV/HCV.
*County totals exclude Department of Corrections cases (N=638).

* County totals exclude Department of Corrections cases (N=638).
HIV/HCV Co-infected Adult Cases, by Race/Ethnicity, Living and Reported through 2013, Florida

Males
N=6,542

- White: 34%
- Black: 41%
- Hispanic: 23%
- Other*: 2%

Females
N=2,768

- White: 29%
- Black: 52%
- Hispanic: 16%
- Other*: 3%

Note: Of the living HIV/HCV Co-infected Adult Cases through 2013: among males 41% are black, 34% are white and 23% are Hispanic. Among females, 52% are black, 29% are white and 16% are Hispanic. *Other includes Asian/Pacific Islanders, Native Alaskans/American Indians and mixed races.
HIV/HCV Co-infected Adult Cases, by Sex and Current Age Group, Living and Reported through 2013, Florida

Males
N=6,542

Females
N=2,768

Comment: In this snapshot of living HIV/HCV Co-infected Adult Cases through 2013, the highest proportion of cases for both males and females was among persons aged 50 and older.
Definitions of Mode of Exposure Categories

- **MSM** = Men who have sex with men
- **IDU** = Injection Drug User
- **MSM/IDU** = Men who have sex with men & Injection Drug User
- **Heterosexual** = Heterosexual contact with person with HIV/AIDS or known HIV risk
- **OTHER** = includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.
- **NIR** = Cases reported with No Identified Risk
- **Redistribution of NIRs** = This illustrates the effect of statistically assigning (redistributing) the NIRs to recognized exposure (risk) categories by applying the proportions of historically reclassified NIRs to the unresolved NIRs.
HIV/HCV co-infection is increasingly recognized worldwide. Rates are particularly high -- up to 90% -- among injection drug users (IDUs), since both viruses are readily transmitted via shared needles and other injection equipment.

Note: Of the 102,189 living adult (age 13+) HIV/AIDS cases in Florida through 2013, 9% were known to be co-infected with HIV/HCV; Overall, 44% of males and 47% of females have a documented IDU-related risk.
* Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks. NIRs redistributed.
HIV/HCV Co-infected Adult Cases, by Sex and Mode of Exposure, Living and Reported through 2013, Area 1

Note: Of the 1,695 living adult (age 13+) HIV/AIDS Cases in Area 1 through 2013, 10% were known to be co-infected with HIV/HCV. Overall, 41% of males and 30% of females have a documented IDU-related risk.
* Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.
Note: NIRs have been redistributed.
HIV/HCV Co-infected Adult Cases, by Sex and Mode of Exposure, Living and Reported through 2013, Area 2a

Males
N=43

- MSM: 35%
- IDU: 28%
- MSM/IDU: 19%

Note: Of the 1,517 living adult (age 13+) HIV/AIDS Cases in Area 12 through 2013, 12% were known to be co-infected with HIV/HCV. Overall, 48% of males and 54% of females have a documented IDU-related risk.

* Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.

Note: NIRs have been redistributed.
HIV/HCV Co-infected Adult Cases, by Sex and Mode of Exposure, Living and Reported through 2013, Area 13

Note: Of the 1,411 living adult (age 13+) HIV/AIDS Cases in Area 13 through 2013, 13% were known to be co-infected with HIV/HCV. Overall, 49% of males and 53% of females have a documented IDU-related risk.
* Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.
Note: NIRs have been redistributed.
HIV/HCV Co-infected Adult Cases, by Sex and Mode of Exposure, Living and Reported through 2013, Area 14

Males
N=140

Females
N=87

Note: Of the 2,020 living adult (age 13+) HIV/AIDS Cases in Area 14 through 2013, 11% were known to be co-infected with HIV/HCV. Overall, 49% of males and 53% of females have a documented IDU-related risk. * Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.
Note: NIRs have been redistributed.
HIV/HCV Co-infected Adult Cases, by Sex and Mode of Exposure, Living and Reported through 2013, Area 15

Males
N=128

- MSM: 13%
- IDU: 2%
- MSM/IDU: 16%
- Heterosexual: 35%

Females
N=98

- MSM: 53%
- IDU: 1%
- MSM/IDU: 1%
- Heterosexual: 46%

Note: Of the 2,288 living adult (age 13+) HIV/AIDS Cases in Area 15 through 2013, 10% were known to be co-infected with HIV/HCV. Overall, 47% of males and 46% of females have a documented IDU-related risk.

* Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.

Note: NIRs have been redistributed.
HIV/HCV Co-infected Adult DOC/FCI* Cases, by Sex and Race/Ethnicity, Living and Reported through 2013, Florida

Among incarcerated males living with HIV/HCV co-infection through 2013, 65% are black, 22% are white, and 12% are Hispanic. Whereas among females, 49% are black, 42% are white, and 5% are Hispanic.

* DOC/FCI are acronyms for Department of Corrections and Federal Correctional Institution.
** Other includes Asian/Pacific Islanders, Native Alaskans/American Indians, and mixed races.
Note: There is a higher proportion of cases among adult males aged 50 and older living with HIV/HCV co-infection, similarly there is a higher proportion of cases among females aged 50 and older.

* DOC/FCI are acronyms for Department of Corrections and Federal Correctional Institution.
Note: Of the 4,273 adults (age 13+) living with HIV disease who were reported from DOC/FCI facilities in Florida through 2013, 15% were known to be co-infected with HIV/HCV. Overall, 66% of males and 67% of females have a documented IDU-related risk.

* DOC/FCI are acronyms for Department of Corrections and Federal Correctional Institution.

** Other includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.

Special Note: NIRs have been redistributed.
After acute HCV infection, progression to chronic hepatitis C is increased from 70%-85% in HIV negative people to more than 90% in HIV positive individuals, particularly those with advanced immunosuppression. Studies have also shown that co-infected people have higher HCV RNA levels, again correlated with degree of immune suppression.

Liver disease is a leading cause of death in HIV-infected individuals in countries with high rates of HIV-HCV co-infection, even in individuals with CD4 counts > 200 cells/mm3.
