Melioidosis (Burkholderia pseudomallei)

Merlin disease code=02500
Case report form (CRF): None
NO CRF REQUIRED

Clinical criteria for case classification
Clinical presentation of the disease varies on a case-by-case basis. The following characteristics are typical of melioidosis.
- An acute or chronic localized infection which may or may not include symptoms of fever and muscle aches. Such infection often results in ulcer, nodule, or skin abscess.
- An acute pulmonary infection with symptoms of high fever, headache, chest pain, anorexia, and general muscle soreness.
- A bloodstream infection with symptoms of fever, headache, respiratory distress, abdominal discomfort, joint pain, muscle tenderness, or disorientation.
- A disseminated infection with symptoms of fever, weight loss, stomach or chest pain, muscle or joint pain, and/or headache or seizure. Abscesses in the liver, lung, spleen, and prostate are often observed in patients diagnosed with disseminated infections; less frequently, brain abscesses may be seen.

Laboratory criteria for case classification
Confirmatory:
Isolation of Burkholderia pseudomallei from blood, urine, sputum, pus, throat swabs, or swabs from organ abscesses or skin lesions.

Presumptive:
Either of the following:
- Evidence of a fourfold or greater rise in B. pseudomallei antibody titer by IHA between acute- and convalescent-phase serum specimens obtained greater than or equal to 2 weeks apart
- Or evidence of B. pseudomallei DNA (for example, by LRN-validated polymerase chain reaction) in a clinical specimen collected from a normally sterile site (blood) or lesion of other affected tissue (abscesses, wound).

Epidemiological criteria for case classification
Either of the following:
- A person who has a history of travel to a melioidosis-endemic region
- Or a person who has a known exposure to B. pseudomallei as a result of intentional release or occupational risk (laboratory exposure).

Case classification
Confirmed:
A person with confirmatory laboratory evidence.

Probable:
A clinically compatible illness in a person with epidemiological criteria.

Criteria to distinguish a new case from previous reports
Not applicable.
Isolates or specimens from all cases must be sent to the Bureau of Public Health Laboratories. This condition has been identified as a potential bioterrorism agent by the CDC.
