Florida Influenza Surveillance

Week Ending February 26, 2005 (Week 8)

Dawn Ginzl, MPH, Florida Epidemic Intelligence Service Fellow

Brittni Jones, Influenza Surveillance Coordinator

Summary

Influenza-like illness (ILI) activity decreased in many regions of the state for the week ending February 26, 2005 (Week 8). The Northeast region experienced regional ILI activity levels above baseline and threshold levels. The Centraleast region experienced regional ILI activity levels above baseline. One County Health Department, Hardee, reported widespread ILI activity. Two County Health Departments, Alachua and Volusia, reported regional ILI activity. Nine County Health Departments reported localized ILI activity (Brevard, Escambia, Hillsborough, Leon, Orange, Palm Beach, Pinellas, Polk, and Sarasota), while nineteen County Health Departments (Baker, Broward, Collier, Duval, Flagler, Hernando, Holmes, Jackson, Lake, Lee, Miami-Dade, Monroe, Nassau, Okaloosa, Santa Rosa, Seminole, St. Johns, Suwannee, and Union) reported sporadic ILI activity during Week 8. Eleven counties reported no ILI activity and twenty-five counties did not report an activity code.

Florida Influenza and Influenza-like Illness (ILI) Surveillance

Table 1 outlines the breakdown of specimen testing and weighted ILI activity by region. The overall weighted percent ILI activity for the state for the week ending February 26, 2005 was 2.64%, compared to the previous week’s ILI activity of 3.22%. The Centraleast region reported the highest influenza activity (4.86%). The Southwest region reported the lowest influenza activity (0.36%). Only 57% of the sentinel physicians across the state reported at the time this report was written.

The ILI activity levels are based on information reported by the Florida Sentinel Physician Influenza Network. The Influenza laboratory information is based on results reported by the state laboratories. During Week 8, the Jacksonville Central and Tampa Branch laboratories received 44 specimens for influenza testing. Of these specimens, 36 tested positive (81.82%) for respiratory viruses: eleven isolates were influenza A H3N2, eleven isolates were influenza A Unknown, one isolate was influenza B Hong Kong, seven isolates were influenza B Shanghai, and six isolates were influenza B Unknown. The lab portion of this report only includes labs that had reported results at the time of this report.

### Influenza-like Illness Graphs By Region

**Baseline:** A bar line that exceeds the baseline indicates moderate ILI activity  
**Threshold:** A bar line that exceeds the threshold indicates high ILI activity
Influenza Surveillance – Definitions and Reminders

Influenza Surveillance Regions

Centraleast: Brevard, Indian River, Lake, Martin, Orange, Osceola, Seminole, St. Lucie and Volusia.

Centralwest: Citrus, Hardee, Hernando, Hillsborough, Manatee, Pasco, Pinellas, Polk and Sumter.

Northwest: Bay, Calhoun, Escambia, Gulf, Holmes, Jackson, Okaloosa, Santa Rosa, Walton and Washington.

Southeast: Broward, Miami-Dade, Monroe and Palm Beach.

Southwest: Charlotte, Collier, Desoto, Glade, Hendry, Highlands, Lee, Okeechobee and Sarasota.

Definitions of the influenza activity codes

No Activity: No laboratory-confirmed cases of influenza and no reported increase in the number of cases of ILI.

Sporadic: Small numbers of laboratory-confirmed influenza cases or a single influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in a single region of the state.

Regional: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least two but less than half the regions of the state.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state.

Important Reminders

* Influenza activity reporting by sentinel providers is voluntary.

* The influenza surveillance data is used to answer the question of where, when, and what viruses are circulating. It can be used to determine if influenza activity is increasing or decreasing, but it cannot be used to ascertain how many people have become ill with influenza so far this season.

* Reporting is incomplete for this week. Numbers may change dramatically as more reports are received.
