This is the first weekly Florida influenza surveillance report for the 2006-07 season. Influenza surveillance* in Florida consists of five surveillance components: 1) Florida Sentinel Physician Influenza Surveillance Network (FSPISN); 2) State laboratory viral surveillance; 3) County influenza activity levels; 4) Notifiable Disease Reports: Influenza-associated deaths in children & post-influenza infection encephalitis; 5) Influenza or ILI outbreaks.

During week 40, the first week of the 2006-07 influenza season, statewide influenza activity was sporadic. The proportion of patient visits for influenza-like illness (ILI) as reported by the Florida Sentinel Physician Influenza Surveillance Network was 1.60 percent and this is below the state baseline of 2.08 percent. One specimen of two tested by Bureau of Laboratories was positive for influenza. Eleven counties reported sporadic activity; and 37 counties reported no activity. Nineteen counties did not report. The graph below shows the progression of the 2005-06 & 2006-07 Florida influenza seasons as monitored by three** of five surveillance systems.

*The purposes of these surveillance systems are to determine when and where influenza activity is occurring, to identify circulating viruses, to detect changes in the circulating influenza viruses, to track patterns of influenza-associated morbidity and mortality and estimate the overall impact of influenza in the state of Florida. **1) FSPISN, 2) State Laboratory Viral Surveillance, and 3) County Activity Levels.
Since October 1, 2006, Florida Department of Health Laboratories tested a total of two specimens for influenza viruses and one (50%) was positive. The specimen was an influenza B virus. The influenza B virus has been subtyped as Influenza B Malaysia.

During week 40, 1.60%* of patient visits to Florida sentinel providers were due to ILI. This percentage is below the statewide baseline of 2.08%**. The percentage of visits ranged from 0.00% in the Northeast region to 2.62% in the Southeast region. For the 2005-06 influenza season the statewide ILI activity percent was 0.56 percent for week 40.

*FSPISN reporting is incomplete for this week (50%). Numbers may change as more reports are received.  
**The baseline is calculated from the previous 3 years of FSPISN data. Only weeks with 10% or greater of laboratory specimens testing positive are included in calculating the baseline. A line exceeding the baseline indicates moderate activity.

### III. FDOH LABORATORY SURVEILLANCE

Since October 1, 2006, Florida Department of Health Laboratories tested a total of two specimens for influenza viruses and one (50%) was positive. The specimen was an influenza B virus. The influenza B virus has been subtyped as Influenza B Malaysia.
The table below shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2005-06 & 2006-07 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.

### Week 40: FSPISN Weighted ILI Activity, by Region
2005-06 & 2006-07 Seasons

During week 40, 11 counties (Brevard, Broward, Clay, Miami-Dade, Escambia, Orange, Palm Beach, Pinellas, St. Johns, Seminole, and Volusia) reported sporadic activity. Thirty-seven counties reported no activity. Nineteen counties did not report.

Weekly County Influenza Activity
(Week ending October 7, 2006 - Week 40)
County influenza activity levels are reported by county health department epidemiologists

Level of Influenza Activity by County:
- No Report
- No Activity
- Sporadic
- Localized
- Widespread

Map printed October 11, 2006
COUNTY INFLUENZA ACTIVITY LEVEL DEFINITIONS

0 = No Activity:
Overall clinical activity remains low with no laboratory confirmed cases† in the county.

1 = Sporadic:
And/or

- a. Isolated cases of laboratory confirmed influenza† in the county.
- b. An ILI§ outbreak in a single setting‡ in the county. (No detection of decreased ILI§ activity by surveillance systems*)

2 = Localized:
And/or

- a. An increase of ILI§ activity detected by a single surveillance system* within the county. (An increase in ILI§ activity has not been detected by multiple ILI surveillance systems.)
- b. Two or more outbreaks (ILI§ or lab confirmed†) detected in a single setting‡ in the county.

AND
Recent (within past three weeks) laboratory evidence† of influenza activity in the county.

3 = Widespread:
And/or

- a. An increase in ILI§ activity detected in ≥2 surveillance systems in the county.
- b. Two or more outbreaks ((ILI§ or laboratory confirmed†) detected in multiple settings‡ in the county.

No Report: (No report was received from the county at the time of publication)

† Laboratory confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
§ ILI = Influenza-like illness, fever ≥100°F AND sore throat and/or cough in the absence of another known cause.
*ILI surveillance system activity can be assessed using a variety of surveillance systems including sentinel providers, school/workplace absenteeism, long-term care facility (LTCF) surveillance, correctional institution surveillance, hospital emergency department surveillance and laboratory surveillance.
‡ Settings include institutional settings (LTCFs, hospitals, prisons, schools, companies) & the community.

VI. REPORTS OF INFLUENZA OR INFLuenza-Like ILLIness (ILI) OUTBREAKS

As of the week ending October 7, 2006, no outbreaks influenza or influenza-like illness in the community or institutional setting were reported to the Bureau of Epidemiology.

Influenza and ILI outbreaks should be reported via EpiCom at: https://www.epicom.fl.net on the Influenza Forum.

VII. NOTIFIABLE DISEASE REPORTS: INFLUENZA-ASSOCIATED DEATHS AMONG CHILDREN (<18 YEARS) & POST-INFLUENZA INFECTION ENCEPHALITIS

As of the week ending October 7, 2006, no influenza-associated deaths among those <18 years of age and/or post influenza infection encephalitis were reported in the state of Florida.

Influenza-associated deaths among those < 18 years of age and/or post-influenza infection encephalitis are reportable; case report forms can be accessed at: http://www.doh.state.fl.us/disease_ctrl/epi/topicscrforms.htm.
Since the recent outbreak activity began at the end of December 2003, there have been a total of 253 confirmed human cases and 148 deaths. Cases and deaths occurred in the following nations: Azerbaijan 8 cases and 5 deaths; Cambodia 6 cases and 6 deaths; China 21 cases and 14 deaths; Djibouti 1 case 0 deaths; Egypt 15 cases and 6 deaths; Indonesia 69 cases and 52 deaths; Iraq 3 cases and 2 deaths; Thailand 25 cases and 17 deaths; Turkey 12 cases and 4 deaths; and, Vietnam 93 cases and 42 deaths. Since the last update on 9/13/06 there have been nine new cases and five new deaths, six cases and four deaths having occurred in Indonesia, one case in Egypt, one case in Iraq (a retrospectively confirmed case from 3/2006), and one case and death in Thailand. All cases had known close contact with various types of poultry, with the exception of 2 cases where it was undetermined. Changes in the WHO case definition for human infection with avian influenza H5N1 can be found here:
For a complete analysis and summary of WHO confirmed human cases of H5N1 from 12/1/2003 to 4/30/2006, please visit:

There have not been reports of avian influenza spreading to new countries in the last few months. The complete list of countries reporting confirmed outbreaks of H5N1 in bird species since late December 2003, with the most recent outbreaks listed first, include Sudan, Spain, Djibouti, Ivory Coast, Czech Republic, Palestinian Autonomous Territories, United Kingdom (Scotland), Burkina Faso, Jordan, Sweden, Israel, Afghanistan, Cameroon, Myanmar, Albania, Serbia and Montenegro, Hungary, Poland, Switzerland, Niger, Slovakia, France, Austria, Malaysia, Azerbaijan, India, Slovenia, Bosnia Herzegovina, Germany, Nigeria, Egypt, Bulgaria, Italy, Greece, Iran, Croatia, Cyprus, Ukraine, Turkey, Romania, Indonesia, China, Russia, Thailand, Vietnam, Kuwait (only one flamingo), Kazakhstan, Mongolia, Cambodia, Korea (Rep. of), and Japan. Countries with confirmed H5 (neuraminidase not determined yet) infection in birds include the Philippines, Iraq, and Laos.

The current phase of alert as defined by the WHO global influenza preparedness plan is phase 3, which states that human infections with a new subtype are occurring, but no human-to-human spread, or at most rare instances of spread to a close contact. At the present time the WHO is not recommending restrictions on travel to areas affected by H5N1 avian influenza, but is suggesting that travelers to these areas avoid contact with live animal markets and poultry farms, and any free-ranging or caged poultry. Evidence suggests that the primary route of infection at this time is associated with direct contact with infected poultry, or surfaces and objects contaminated by their droppings.
