FLORIDA INFLUENZA SURVEILLANCE

Week 52: December 24th — December 30th 2006

Aimee Pragle, MS, Respiratory Disease Epidemiologist
Matt Laidler, MA, MPH, Surveillance Epidemiologist
LaKisha Thomas, Influenza Surveillance Coordinator
D’Juan Harris, MSP, GIS Coordinator
Aaron Kite-Powell, MS, Florida EIS Officer

IN THIS ISSUE:

I. Summary
II. FSPISN Influenza-like Illness Statewide Graph
III. Florida Pneumonia & Influenza Mortality Surveillance System
IV. FDOH Laboratory Surveillance
V. Laboratory and Influenza-like Illness Surveillance by Region
VI. County Influenza Activity Map
VII. Reports of Influenza or Influenza-like Illness (ILI) Outbreaks
VIII. Notifiable Disease Reports: Influenza-associated deaths in children & post-influenza infection encephalitis
IX. Summary of Worldwide A/H5N1 Influenza Activity

I. SUMMARY

This is the thirteenth weekly Florida influenza surveillance report for the 2006-07 season. Influenza surveillance* in Florida consists of six surveillance components: 1) Florida Sentinel Physician Influenza Surveillance Network (FSPISN); 2) Florida Pneumonia & Influenza Mortality Surveillance System; 3) State laboratory viral surveillance; 4) County influenza activity levels; 5) Notifiable Disease Reports: Influenza-associated deaths in children & post-influenza infection encephalitis; 6) Influenza or ILI outbreaks.

During week 52 statewide influenza activity was widespread. The proportion of patient visits for influenza-like illness (ILI) as reported by the Florida Sentinel Physician Influenza Surveillance Network was 2.68 percent and this is above the state threshold for moderate activity of 2.08 percent. Seventeen of the 35 specimens (49%) tested by Bureau of Laboratories were positive for influenza. One county reported widespread activity, 11 counties reported localized activity, 13 counties reported sporadic activity and 25 counties reported no activity. Seventeen counties did not report. The graph below shows the progression of the 2005-06 & 2006-07 Florida influenza seasons as monitored by three** of five surveillance systems.

FLORIDA INFLUENZA SURVEILLANCE DATA FOR 2005-06 & 2006-07 AS REPORTED BY THREE DIFFERENT SURVEILLANCE SYSTEMS**

*The purposes of these surveillance systems are to determine when and where influenza activity is occurring, to identify circulating viruses, to detect changes in the circulating influenza viruses, to track patterns of influenza-associated morbidity and mortality and estimate the overall impact of influenza in the state of Florida.

Find more information at: http://www.doh.state.fl.us/disease_ctrl/epi/htopics/flu/index.htm
During week 52, 2.68%* of patient visits to Florida sentinel providers were due to ILI. This percentage is above the 2006—07 statewide threshold for moderate activity of 2.08%**. The percentage of visits ranged from 0.14% in the Southwest region to 6.07% in the Centraleast region. For the 2005-06 influenza season the statewide ILI activity percentage was 1.51% for week 52.

*FSPISN reporting is incomplete for this week (50%). Numbers may change as more reports are received.

**The 2006—07 threshold for moderate activity is calculated from the previous 3 years of FSPISN data. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. The threshold is only specific to 2006—07 data.
Since October 1, 2006, Florida Department of Health Laboratories have tested a total of 265 specimens for influenza viruses and 124 (47%) were positive. Among the 124 influenza viruses, 88 (71%) were influenza A viruses and 36 (29%) were influenza B viruses. One hundred and seven of the 124 influenza viruses have been subtyped. Of the Influenza A viruses, 69 were A H1N1, 1 was A H3N2 and 18 were A unsubtyped. Of the 36 influenza B viruses, 24 have been subtyped as influenza B Malaysia, 6 as influenza B Shanghai, and 6 were B unsubtyped. Laboratory information is preliminary and may change as additional results are received.
The table below shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2005-06 & 2006-07 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.

***insufficient data to provide activity percentage for Northwest region
During week 52, Franklin county reported widespread activity. Localized activity was reported by 11 counties (Broward, Citrus, Duval, Escambia, Hardee, Hernando, Okaloosa, Palm Beach, Santa Rosa, Seminole, and Volusia). Thirteen counties (Bay, Collier, Hillsborough, Indian River, Lake, Leon, Okeechobee, Orange, Pinellas, Polk, St. Johns, and Sarasota) reported sporadic activity. Twenty-six counties reported no activity. Sixteen counties did not report.
COUNTY INFLUENZA ACTIVITY LEVEL DEFINITIONS

0 = No Activity:
Overall clinical activity remains low with no laboratory confirmed cases† in the county.

1 = Sporadic:
And/or
   a. Isolated cases of laboratory confirmed influenza† in the county.
   b. An ILI§ outbreak in a single setting‡ in the county. (No detection of decreased ILI§ activity by surveillance systems*)

2 = Localized:
And/or
   a. An increase of ILI§ activity detected by a single surveillance system* within the county.
      (An increase in ILI§ activity has not been detected by multiple ILI surveillance systems.)
   b. Two or more outbreaks (ILI§ or laboratory confirmed†) detected in a single setting‡ in the county.

2 = Localized:
And/or
   a. An increase of ILI§ activity detected by a single surveillance system* within the county.
      (An increase in ILI § activity has not been detected by multiple ILI surveillance systems.)
   b. Two or more outbreaks (ILI§ or laboratory confirmed†) detected in a single setting‡ in the county.

3 = Widespread:
And/or
   a. An increase in ILI§ activity detected in ≥2 surveillance systems in the county.
   b. Two or more outbreaks ([ILI§ or laboratory confirmed†]) detected in multiple settings‡ in the county.

No Report: (No report was received from the county at the time of publication)

† Laboratory confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
§ ILI = Influenza-like illness, fever ≥100°F AND sore throat and/or cough in the absence of another known cause.
* ILI surveillance system activity can be assessed using a variety of surveillance systems including sentinel providers, school/workplace absenteeism, long-term care facility (LTCF) surveillance, correctional institution surveillance, hospital emergency department surveillance and laboratory surveillance.
‡ Settings include institutional settings (LTCFs, hospitals, prisons, schools, companies) & the community.

VII. REPORTS OF INFLUENZA OR INFLUENZA-LIKE ILLNESS (ILI) OUTBREAKS

Posted on EpiCom December 22, 2006: The Seminole CHD Epidemiology unit reported an increase in positive laboratory results from local hospitals. Public Health prevention measures resulted in a flu clinic being held in residence area with greatest number of cases.

Posted on EpiCom December 18, 2006: The Escambia CHD Epidemiology unit reported influenza-like illness in students in 28 Escambia County schools with onset of symptoms from 11/27 to 12/15.

Posted on EpiCom November 7, 2006: Miami-Dade and Broward CHD Epidemiology units reported an increase of influenza activity in children in Southeast Florida as detected from mid October to current by the following surveillance systems: laboratory viral surveillance, sentinel physician ILI surveillance, and ESSENCE syndromic surveillance.

A description of reported influenza or ILI outbreaks in community or institutional settings can be viewed via EpiCom at: https://www.epicom.fl.net. Influenza and ILI outbreaks should be reported via EpiCom.

VIII. NOTIFIABLE DISEASE REPORTS: INFLUENZA-ASSOCIATED DEATHS AMONG CHILDREN (<18 YEARS) & POST-INFLUENZA INFECTION ENCEPHALITIS

As of the week ending December 30, 2006, 1 influenza-associated deaths among those <18 years of age and/or post influenza infection encephalitis was reported in the state of Florida.

Influenza-associated deaths among those < 18 years of age and/or post-influenza infection encephalitis are reportable; case report forms can be accessed at: http://www.doh.state.fl.us/disease_ctrl/epi/topicscrforms.htm.
Since the recent outbreak activity began at the end of December 2003, there have been a total of 261 confirmed human cases and 157 deaths*. Cases and deaths occurred in the following nations: Azerbaijan 8 cases and 5 deaths; Cambodia 6 cases and 6 deaths; China 21 cases and 14 deaths; Djibouti 1 case 0 deaths; Egypt 18 cases and 10 deaths; Indonesia 74 cases and 57 deaths; Iraq 3 case and 2 deaths; Thailand 25 cases and 17 deaths; Turkey 12 cases and 4 deaths; and, Vietnam 93 cases and 42 deaths. Since the last update on 12/21/06 there has been three new human cases of A (H5N1) virus infection. All three cases belong to one extended family near Cairo, Egypt. While being transferred and cared for at the country’s designated avian influenza hospital, a 30 year-old female, a 15 year-old girl and a 26 year-old male died. The cases reportedly had contact with sick poultry (ducks).

There have not been reports of avian influenza spreading to new countries in the last few months. The complete list of countries reporting confirmed outbreaks of H5N1 in bird species since late December 2003, with the most recent outbreaks listed first, include Sudan, Spain, Djibouti, Ivory Coast, Czech Republic, Palestinian Autonomous Territories, United Kingdom (Scotland), Burkina Faso, Jordan, Sweden, Israel, Afghanistan, Cameroun, Myanmar, Albania, Serbia and Montenegro, Hungary, Poland, Switzerland, Niger, Slovakia, France, Austria, Malaysia, Azerbaijan, India, Slovenia, Bosnia Herzegovina, Germany, Nigeria, Egypt, Bulgaria, Italy, Greece, Iran, Croatia, Cyprus, Ukraine, Turkey, Romania, Indonesia, China, Russia, Thailand, Vietnam, Kuwait (only one flamingo), Kazakhstan, Mongolia, Cambodia, Korea (Rep. of), and Japan. Countries with confirmed H5 (neuraminidase not determined yet) infection in birds include the Philippines, Iraq, and Laos.

The current phase of alert as defined by the WHO global influenza preparedness plan is phase 3, which states that human infections with a new subtype are occurring, but no human-to-human spread, or at most rare instances of spread to a close contact. At the present time the WHO is not recommending restrictions on travel to areas affected by H5N1 avian influenza, but is suggesting that travelers to these areas avoid contact with live animal markets and poultry farms, and any free-ranging or caged poultry. Evidence suggests that the primary route of infection at this time is associated with direct contact with infected poultry, or surfaces and objects contaminated by their droppings.

*All confirmed results are from official sources – WHO, CDC, FAO. Information on suspect cases comes from a variety of sources including Epi-X, Promed, and the official sources mentioned above.
