This is the fourteenth weekly Florida influenza surveillance report for the 2006-07 season. Influenza surveillance* in Florida consists of six surveillance components: 1) Florida Sentinel Physician Influenza Surveillance Network (FSPISN); 2) Florida Pneumonia & Influenza Mortality Surveillance System; 3) State laboratory viral surveillance; 4) County influenza activity levels; 5) Notifiable Disease Reports: Influenza-associated deaths in children & post-influenza infection encephalitis; 6) Influenza or ILI outbreaks.

During week 1 statewide influenza activity was regional. The proportion of patient visits for influenza-like illness (ILI) as reported by the Florida Sentinel Physician Influenza Surveillance Network was 2.09 percent and this is above the state threshold for moderate activity of 2.08 percent. Eleven of the 37 specimens (30%) tested by Bureau of Laboratories were positive for influenza. One county reported widespread activity, 7 counties reported localized activity, 18 counties reported sporadic activity and 21 counties reported no activity. Twenty counties did not report. The graph below shows the progression of the 2005-06 & 2006-07 Florida influenza seasons as monitored by three** of five surveillance systems.

*IThe purposes of these surveillance systems are to determine when and where influenza activity is occurring, to identify circulating viruses, to detect changes in the circulating influenza viruses, to track patterns of influenza-associated morbidity and mortality and estimate the overall impact of influenza in the state of Florida.

Find more information at: http://www.doh.state.fl.us/disease_ctrl/epi/htopics/flu/index.htm
Due to insufficient data provided for week 52, the P&I mortality graph cannot be generated. Additional data will be provided when sufficient data is received.

II. FSPISN INFLUENZA-LIKE ILLNESS STATEWIDE GRAPH

During week 1, 2.09%* of patient visits to Florida sentinel providers were due to ILI. This percentage is above the 2006—07 statewide threshold for moderate activity of 2.08%**. The percentage of visits ranged from 0.00% in the Southwest region to 3.68% in the Centraleast region. For the 2005-06 influenza season the statewide ILI activity percentage was 1.19% for week 1.

*FSPISN reporting is incomplete for this week (60%). Numbers may change as more reports are received.

**The 2006—07 threshold for moderate activity is calculated from the previous 3 years of FSPISN data. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. The threshold is only specific to 2006—07 data.

III. THE FLORIDA PNEUMONIA & INFLUENZA MORTALITY SURVEILLANCE SYSTEM

Due to insufficient data provided for week 52, the P&I mortality graph cannot be generated. Additional data will be provided when sufficient data is received.
Since October 1, 2006, Florida Department of Health Laboratories have tested a total of 302 specimens for influenza viruses and 135 (45%) were positive. Among the 135 influenza viruses, 94 (70%) were influenza A viruses and 41 (30%) were influenza B viruses. One hundred and thirty-one of the 135 influenza viruses have been subtyped. Of the Influenza A viruses, 92 were A H1N1, 1 was A H3N2 and 1 was A unsubtyped. Of the 41 influenza B viruses, 34 have been subtyped as influenza B Malaysia, 7 as influenza B Shanghai. 

_Laboratory information is preliminary and may change as additional results are received._
The table below shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2005-06 & 2006-07 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.

During week 1, Lee county reported widespread activity. Localized activity was reported by 7 counties (Escambia, Hardee, Hernando, Leon, Nassau, Polk and Santa Rosa). Eighteen counties (Brevard, Broward, Collier, Dade, Flagler, Hillsborough, Lake, Monroe, Okaloosa, Okeechobee, Orange, Osceola, Palm Beach, Pinellas, St. Johns, St. Lucie, Sarasota, and Volusia) reported sporadic activity. 21 counties reported no activity. Twenty counties did not report.
COUNTY INFLUENZA ACTIVITY LEVEL DEFINITIONS

0 = No Activity:
Overall clinical activity remains low with no laboratory confirmed cases† in the county.

1 = Sporadic:
   And/or
   a. Isolated cases of laboratory confirmed influenza† in the county.
   b. An ILI§ outbreak in a single setting‡ in the county. (No detection of decreased ILI§ activity by surveillance systems*)

2=Localized:
   And/or
   a. An increase of ILI§ activity detected by a single surveillance system* within the county.
      (An increase in ILI§ activity has not been detected by multiple ILI surveillance systems.)
   b. Two or more outbreaks (ILI§ or lab confirmed†) detected in a single setting‡ in the county.

AND
Recent (within past three weeks) laboratory evidence† of influenza activity in the county.

3=Widespread:
   And/or
   a. An increase in ILI§ activity detected in ≥2 surveillance systems in the county.
   b. Two or more outbreaks ((ILI§ or laboratory confirmed†) detected in multiple settings‡ in the county.

No Report: (No report was received from the county at the time of publication)
† Laboratory confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
§ ILI = Influenza-like illness, fever ≥100°F AND sore throat and/or cough in the absence of another known cause.
*ILI surveillance system activity can be assessed using a variety of surveillance systems including sentinel providers, school/workplace absenteeism, long-term care facility (LTCF) surveillance, correctional institution surveillance, hospital emergency department surveillance and laboratory surveillance.
‡Settings include institutional settings (LTCFs, hospitals, prisons, schools, companies) & the community.

VII. REPORTS OF INFLUENZA OR INFLUENZA-LIKE ILLNESS (ILI) OUTBREAKS

Posted on EpiCom December 22, 2006: The Seminole CHD Epidemiology unit reported an increase in positive laboratory results from local hospitals. Public Health prevention measures resulted in a flu clinic being held in residence area with greatest number of cases.

Posted on EpiCom December 18, 2006: The Escambia CHD Epidemiology unit reported influenza-like illness in students in 28 Escambia County schools with onset of symptoms from 11/27 to 12/15.

Posted on EpiCom November 7, 2006: Miami-Dade and Broward CHD Epidemiology units reported an increase of influenza activity in children in Southeast Florida as detected from mid October to current by the following surveillance systems: laboratory viral surveillance, sentinel physician ILI surveillance, and ESSENCE syndromic surveillance.

A description of reported influenza or ILI outbreaks in community or institutional settings can be viewed via EpiCom at: https://www.epicom.fl.net. Influenza and ILI outbreaks should be reported via EpiCom.

VIII. NOTIFIABLE DISEASE REPORTS: INFLUENZA-ASSOCIATED DEATHS AMONG CHILDREN (<18 YEARS) & POST-INFLUENZA INFECTION ENCEPHALITIS

As of the week ending January 6, 2007, 1 influenza-associated deaths among those <18 years of age and/or post influenza infection encephalitis was reported in the state of Florida.

Influenza-associated deaths among those < 18 years of age and/or post-influenza infection encephalitis are reportable; case report forms can be accessed at: http://www.doh.state.fl.us/disease_ctrl/epi/topicscrforms.htm.
XI. SUMMARY OF WORLDWIDE A/H5N1 INFLUENZA ACTIVITY

Update 42 1/12/2007

Since the recent outbreak activity began at the end of December 2003, there have been a total of 265 confirmed human cases and 159 deaths*. Cases and deaths occurred in the following nations: Azerbaijan 8 cases and 5 deaths; Cambodia 6 cases and 6 deaths; China 22 cases and 14 deaths; Djibouti 1 case 0 deaths; Egypt 18 cases and 10 deaths; Indonesia 77 cases and 59 deaths; Iraq 3 case and 2 deaths; Thailand 25 cases and 17 deaths; Turkey 12 cases and 4 deaths; and, Vietnam 93 cases and 42 deaths. Since the last update on 1/05/07 there has been one case in China, and three cases and two deaths in Indonesia. The case in China is the first in months. It occurred in a 37 yr old male who is a farmer and who may have kept poultry, although specific exposures are still being investigated. He is reportedly recovering well. The Indonesian cases and death reportedly lived in an area where recent poultry deaths have occurred. Investigations into specific exposures are ongoing. Changes in the WHO case definition for human infection with avian influenza H5N1 can be found here:

For a complete analysis and summary of WHO confirmed human cases of H5N1 from 12/1/2003 to 4/30/2005, please visit:

There have not been reports of avian influenza spreading to new countries in the last few months. The complete list of countries reporting confirmed outbreaks of H5N1 in bird species since late December 2003, with the most recent outbreaks listed first, include Sudan, Spain, Djibouti, Ivory Coast, Czech Republic, Palestinian Autonomous Territories, United Kingdom (Scotland), Burkina Faso, Jordan, Sweden, Israel, Afghanistan, Cameroon, Myanmar, Albania, Serbia and Montenegro, Hungary, Poland, Switzerland, Niger, Slovakia, France, Austria, Malaysia, Azerbaijan, India, Slovenia, Bosnia Herzegovina, Germany, Nigeria, Egypt, Bulgaria, Italy, Greece, Iran, Croatia, Cyprus, Ukraine, Turkey, Romania, Indonesia, China, Russia, Thailand, Vietnam, Kuwait (only one flamingo), Kazakhstan, Mongolia, Cambodia, Korea (Rep. of), and Japan. Countries with confirmed H5 (neuraminidase not determined yet) infection in birds include the Philippines, Iraq, and Laos.

The current phase of alert as defined by the WHO global influenza preparedness plan is phase 3, which states that human infections with a new subtype are occurring, but no human-to-human spread, or at most rare instances of spread to a close contact. At the present time the WHO is not recommending restrictions on travel to areas affected by H5N1 avian influenza, but is suggesting that travelers to these areas avoid contact with live animal markets and poultry farms, and any free-ranging or caged poultry. Evidence suggests that the primary route of infection at this time is associated with direct contact with infected poultry, or surfaces and objects contaminated by their droppings.

*All confirmed results are from official sources – WHO, CDC, FAO. Information on suspect cases comes from a variety of sources including Epi-X, Promed, and the official sources mentioned above.
