This is the eleventh weekly Florida influenza surveillance report for the 2008-09 season. Influenza surveillance in Florida consists of seven surveillance components*: 1) Florida Sentinel Physician Influenza Surveillance Network (FSPISN); 2) Florida Pneumonia & Influenza Mortality Surveillance System; 3) State laboratory viral surveillance; 4) County influenza activity levels; 5) Notifiable Disease Reports: Influenza-associated deaths in children & post-influenza infection encephalitis; 6) Influenza or ILI outbreaks; 7) Syndromic surveillance.

During week 50 (12/07/08-12/13/08), the proportion of patient visits for influenza-like illness (ILI) as reported by the Florida Sentinel Physician Influenza Surveillance Network was 2.03 percent. This is below the state threshold for moderate activity of 2.98 percent. Six of the twenty-three ILI specimens tested by Bureau of Laboratories were positive for influenza. No counties reported widespread activity and four counties reported localized activity. Twenty-one counties reported sporadic activity and 22 counties reported no activity. Twenty counties did not report. The graph below shows the progression of the 2007-08 & 2008-09 Florida influenza seasons as monitored by three** of seven surveillance systems.

Each week an activity code for the state as a whole is reported to the Centers for Disease Control and Prevention (CDC). There are five possible categories: No Activity, Sporadic, Local, Regional, or Widespread. Sporadic activity has been reported in Florida for this reporting week (week 50). Florida meets the CDC sporadic activity definition. The CDC definition for sporadic activity is: Small numbers of laboratory-confirmed influenza cases or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI. The CDC report can be viewed at http://www.cdc.gov/flu/weekly/usmap.htm.

*The purposes of these surveillance systems are to determine when and where influenza activity is occurring, to identify circulating viruses, to detect changes in the circulating influenza viruses, to track patterns of influenza-associated morbidity and mortality and estimate the overall impact of influenza in the state of Florida.

**1) FSPISN, 2) State Laboratory Viral Surveillance, and 3) County Activity Levels.
Please refer to the most recent national data compiled by the CDC below. Three major metropolitan locations participate in the national 122 Cities Mortality Reporting System. Florida is currently in the process of updating the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS). Twenty-three counties participate in the FPIMSS. During week 50, three counties did not report. Data from all participating counties are required to accurately display the data in this report.

During week 50, 2.03%* of patient visits to Florida sentinel providers were due to ILI. This percentage is below the statewide threshold for moderate activity of 2.98%**. The percentage of visits ranged from 0.28% in the Centralwest to 5.14% in the Southwest region.

*FSPISN reporting is incomplete for this week (42% of providers reported). Numbers may change as more reports are received. Data displayed is weighted to the state population.

**The 2008—09 threshold for moderate activity is calculated from FSPISN data. The threshold for moderate activity is the mean percentage of patient visits for ILI during influenza weeks for the previous three seasons plus two standard deviations. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. Due to wide variability in regional level data, it is not appropriate to apply the state baseline to regional data.

^ There was no week 53 during the 2006-07 and 2007-08 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

Pneumonia and Influenza (P&I) Mortality Surveillance: During week 50, 6.8% of all deaths reported through the 122-Cities Mortality Reporting System were due to P&I. This percentage is below the epidemic threshold of 7.3% for week 50.
During week 50, Florida Department of Health Bureau of Laboratories tested a total of 23 specimens for influenza viruses. Six (26%) of 23 were positive for influenza. Two were influenza A H1, two were influenza B Florida, one was influenza B Malaysia, and one was influenza B unknown. The Bureau of Laboratories have tested a total of 128 specimens so far this season. Laboratory information is preliminary and may change as additional results are received. Totals from previous weeks will be adjusted to reflect correct specimen numbers.

*Please note that the graph displays positive influenza isolates in each county reported during week 50. Totals will be adjusted to reflect actual week of positive specimen.
The table below shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2007-08 & 2008-09 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.

The table above shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2007-08 & 2008-09 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.
During week 50, no counties reported widespread activity and four counties (Alachua, Broward, Pasco, Pinellas) reported localized activity. Twenty-one counties (Brevard, Charlotte, Collier, DeSoto, Duval, Escambia, Hillsborough, Indian River, Lafayette, Lake, Levy, Manatee, Marion, Okaloosa, Palm Beach, Santa Rosa, Sarasota, Seminole, Union, Volusia, Walton) reported sporadic activity. Twenty-two counties reported no activity. Twenty counties did not report.

**Weekly County Influenza Activity**

(Week ending December 13, 2008 - Week 50)

County influenza activity levels are reported by county health department epidemiologists.
0 = No Activity: 
Overall clinical activity remains low with no laboratory confirmed cases† in the county.

1 = Sporadic: 
And/or 
- a. Isolated cases of laboratory confirmed influenza† in the county.
- b. An ILI§ outbreak in a single setting‡ in the county. (No detection of decreased ILI§ activity by surveillance systems*)

2 = Localized: 
And/or 
- a. ILI§ activity detected by a single surveillance system* within the county.
- b. Two or more outbreaks (ILI§ or lab confirmed†) detected in a single setting‡ in the county.

AND 
- c. Recent (within past three weeks) laboratory evidence† of influenza activity in the county.

3 = Widespread: 
And/or 
- a. An increase in ILI§ activity detected in ≥2 surveillance systems in the county.
- b. Two or more outbreaks ((ILI§ or laboratory confirmed†) detected in multiple settings‡) in the county.

No Report: (No report was received from the county at the time of publication)
† Laboratory confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
§ILI = Influenza-like illness, fever ≥ 100°F AND sore throat and/or cough in the absence of another known cause.
*ILI surveillance system activity can be assessed using a variety of surveillance systems including sentinel providers, school/workplace absenteeism, long-term care facility (LTCF) surveillance, correctional institution surveillance, hospital emergency department surveillance and laboratory surveillance.
‡Settings include institutional settings (LTCFs, hospitals, prisons, schools, companies) & the community.

VII. REPORTS OF INFLUENZA OR INFLUENZA-LIKE ILLNESS (ILI) OUTBREAKS

During week 50, there were no reports of influenza or influenza-like illness outbreaks in the state.

County Health Department epidemiologists should report Influenza and ILI outbreaks via EpiCom at: https://fdens.com/vabrts/GateStart.aspx within the Influenza Forum.

VIII. NOTIFIABLE DISEASE REPORTS: INFLUENZA-ASSOCIATED DEATHS AMONG CHILDREN (<18 YEARS) & POST-INFLUENZA INFECTION ENCEPHALITIS

As of the week ending December 13, 2008, there were no influenza-associated deaths among those <18 years of age and/or post influenza infection encephalitis reported in the state of Florida.

<table>

Influenza-associated deaths among those <18 years of age and/or post-influenza infection encephalitis are reportable; case report forms can be accessed at: http://www.doh.state.fl.us/disease_ctrl/epi/topicscrforms.htm.
Syndromic surveillance ILI data as monitored through the ESSENCE system is a newly added component of the overall state influenza surveillance program. Florida uses the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE) for syndromic surveillance, which currently collects data from 86* hospitals. These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is influenza-like illness (ILI), which is composed of chief complaints that include the words "influenza" or "flu", or either fever and cough or sore throat. The data are collected on a daily basis from participating hospital emergency departments (ED) across the state. Displayed below are the percentage of ILI visits to local EDs from 2006 to 2008 by week.

*The total number of facilities participating in ESSENCE has increased steadily from 2006 to 2008. In 2007 ESSENCE was implemented as the state syndromic surveillance system. Please note that numbers may change as facility data is updated.
Since the outbreak activity began at the end of December 2003, there have been a total of 391 confirmed human cases and 246 deaths. Cases and deaths have occurred in the following nations: Azerbaijan 8 cases and 5 deaths; Bangladesh 1 case 0 deaths; Cambodia 8 cases and 7 deaths; China 30 cases and 20 deaths; Djibouti 1 case 0 deaths; Egypt 51 cases and 22 deaths; Indonesia 139 cases and 113 deaths; Iraq 3 cases and 2 deaths; Lao People’s Democratic Republic 2 cases and 2 deaths; Myanmar 1 case and 0 deaths; Nigeria 1 case and 1 death; Pakistan 3 cases and 1 death. Thailand 25 cases and 17 deaths; Turkey 12 cases and 4 deaths; and, Vietnam 106 cases and 52 deaths. For a complete analysis and summary of WHO confirmed human cases of H5N1 from 12/1/2003 to current, please visit: http://www.who.int/csr/disease/avian_influenza/ai_timeline/en/index.html

During week 50, the Ministry of Health of Indonesia announced two new confirmed cases of human infection with the H5N1 avian influenza virus from November 2008. They included a 9-year-old female from Riau Province who developed symptoms on November 7th, was hospitalized on November 12th, and was discharged from the hospital on November 27th. Poultry deaths had occurred at the home of the case patient prior to her illness. The second case was in a 2-year-old female from East Jakarta that developed symptoms on November 18th, was hospitalized on November 26th, and died on November 29th. Source of exposure was a live bird market.

The Ministry of Health of Cambodia also announced a new confirmed case of human infection of H5N1 in a 19-year-old male from the Kandal Province that took place in November 2008. The case developed symptoms on November 28th, sought medical attention on November 30th, and was admitted to the hospital. Investigation is ongoing to find the source of his infection. Contacts of the case are being identified and provided with prophylaxis.

The current phase of alert as defined by the WHO global influenza preparedness plan is phase 3, which states that human infections with a new subtype are occurring, but no human-to-human spread, or at most rare instances of spread to a close contact. At the present time the WHO is not recommending restrictions on travel to areas affected by H5N1 avian influenza, but is suggesting that travelers to these areas avoid contact with live animal markets and poultry farms, and any free-ranging or caged poultry. Evidence suggests that the primary route of infection at this time is associated with direct contact with infected poultry, or surfaces and objects contaminated by their droppings.

Human cases of influenza due to infection from novel or pandemic strains are reportable in Florida. Reports should be made to the Department 24/7 upon initial suspicion.
