I. SUMMARY

This is the twenty-seventh weekly Florida influenza surveillance report for the 2008-09 season. Influenza surveil-
lance in Florida consists of seven surveillance components: 1) Florida Sentinel Physician Influenza Surveillance
Network (FSPISN); 2) Florida Pneumonia & Influenza Mortality Surveillance System; 3) State laboratory viral sur-
veillance; 4) County influenza activity levels; 5) Notifiable Disease Reports: Influenza-associated deaths in chil-
dren & post-influenza infection encephalitis; 6) Influenza or ILI outbreaks; 7) Syndromic surveillance.

During week 13 (03/28/09-04/04/09), the proportion of patient visits for influenza-like illness (ILI) as reported by the
Florida Sentinel Physician Influenza Surveillance Network was 1.59 percent. This is below the state threshold for
moderate activity of 2.98 percent. Eight of the twenty-two ILI specimens tested by Bureau of Laboratories were
positive for influenza. No counties reported widespread activity and three counties reported localized activity.
Twenty-two counties reported sporadic activity and 25 counties reported no activity. Seventeen counties did not
report. The graph below shows the progression of the 2007-08 & 2008-09 Florida influenza seasons as monitored
by three** of seven surveillance systems.

Each week an activity code for the state as a whole is reported to the Centers for Disease Control and Prevention
(CDC). There are five possible categories: No Activity, Sporadic, Local, Regional, or Widespread. Local activity
has been reported in Florida for this reporting week (week 13). Florida meets the CDC local activity definition.
The CDC definition for local activity is: Outbreaks of influenza or increases in ILI cases and recent laboratory-
confirmed influenza in a single region of the state with recent laboratory evidence of influenza in those regions.

*The purposes of these surveillance systems are to determine when and where influenza activity is occurring, to identify circulating viruses, to detect
changes in the circulating influenza viruses, to track patterns of influenza-associated morbidity and mortality and estimate the overall impact of influ-
enza in the state of Florida.
**1) FSPISN, 2) State Laboratory Viral Surveillance, and 3) County Activity Levels. 

Find more information at: http://www.doh.state.fl.us/disease_ctrl/epi/htopics/flu/index.htm
During week 13, the total count of pneumonia and influenza (P&I) deaths reported was below the epidemic threshold. This indicates there were no deaths in excess of the expected count for week 13 and observed mortality does not indicate that Florida has surpassed the epidemic threshold for this week.

During week 13, 1.59% of patient visits to Florida sentinel providers were due to ILI. This percentage is below the statewide threshold for moderate activity of 2.98%. The percentage of visits ranged from 0.55% in the Northcentral to 2.86% in the Southeast region.

II. FSPISN INFLUENZA-LIKE ILLNESS STATEWIDE GRAPH

Percentage of Visits for Influenza-like Illness Reported by Sentinel Providers Statewide Summary 2008-09, 2007-08, and 2006-07

% of Visits for ILI^*  
0.000%  1.000%  2.000%  3.000%  4.000%  5.000%  6.000%  
40  42  44  46  48  50  52  54  56  58  60  62  64  66

Week

2006-07^  2007-08^  2008-09 - - - State Threshold for Moderate Activity: 2.98%

^FSPISN reporting is incomplete for this week (37% of providers reported). Numbers may change as more reports are received. Data displayed is weighted to the state population.

**The 2008—09 threshold for moderate activity is calculated from FSPISN data. The threshold for moderate activity is the mean percentage of patient visits for ILI during influenza weeks for the previous three seasons plus two standard deviations. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. Due to wide variability in regional level data, it is not appropriate to apply the state baseline to regional data.

^* There was no week 53 during the 2006-07 and 2007-08 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

III. FLORIDA PNEUMONIA AND INFLUENZA MORTALITY SURVEILLANCE

During week 13, the total count of pneumonia and influenza (P&I) deaths reported was below the epidemic threshold. This indicates there were no deaths in excess of the expected count for week 13 and observed mortality does not indicate that Florida has surpassed the epidemic threshold for this week**.

Pneumonia and Influenza Mortality for 24 Florida Counties, Counts Model

**Twenty-three of 24 counties reported P&I deaths to create this trend graph. Please note: Data from Volusia was not available. 100% participation is required for this graph to provide an accurate representation. We look forward to 100% participation for the duration of the influenza season.
During week 13, Florida Department of Health Bureau of Laboratories tested a total of 22 specimens for influenza viruses. Eight (36%) of 22 were positive for influenza. Four were influenza AH1, none were influenza A H3, two were influenza A unknown, one was influenza B Malaysia, and was influenza B unknown. The Bureau of Laboratories have tested a total of 562 specimens so far this season. Out of the 562 tested, 301 (53%) isolates were positive: 156 (52%) of the 301 isolates have been influenza A and 144 (48%) influenza B isolates. Laboratory information is preliminary and may change as additional results are received. Totals from previous weeks will be adjusted to reflect correct specimen numbers.
The table below shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2007-08 & 2008-09 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.

### Week 13: FSPISN Weighted ILI Activity, by Region 2007-08 & 2008-09 Seasons

The table above shows the weighted ILI activity by region as reported by Florida sentinel physicians for the 2007-08 & 2008-09 seasons. The graphs below include ILI activity as reported by sentinel physicians and FDOH laboratory data.
During week 13, no counties reported widespread activity. Three counties reported localized activity (Broward, Miami-Dade, Pasco). Twenty-two counties (Alachua, Baker, Brevard, Collier, DeSoto, Duval, Escambia, Hardee, Hernando, Hillsborough, Jackson, Lee, Manatee, Martin, Monroe, Palm Beach, Pinellas, Polk, Santa Rosa, Sarasota, Seminole, Volusia) reported sporadic activity. Twenty-five counties reported no activity. Seventeen counties did not report. Please note: data reported from counties reporting after the deadline are recorded but may not be included in the activity map below.
COUNTY INFLUENZA ACTIVITY LEVEL DEFINITIONS

0 = No Activity:
Overall clinical activity remains low with no laboratory confirmed cases† in the county.

1 = Sporadic:
And/or
a. Isolated cases of laboratory confirmed influenza† in the county.
b. An ILI§ outbreak in a single setting‡ in the county. (No detection of decreased ILI§ activity by surveillance systems*)

2 = Localized:
And/or
a. ILI§ activity detected by a single surveillance system* within the county.
   ILI§ activity has not been detected by multiple ILI surveillance systems.
   b. Two or more outbreaks (ILI§ or lab confirmed†) detected in a single setting‡ in the county.
   AND
   c. Recent (within past three weeks) laboratory evidence‡ of influenza activity in the county.

3 = Widespread:
And/or
a. An increase in ILI§ activity detected in ≥2 surveillance systems in the county.
   b. Two or more outbreaks ((ILI§ or laboratory confirmed†) detected in multiple settings‡ in the county.
   AND
   c. Recent (within past three weeks) laboratory evidence‡ of influenza activity in the county.

No Report: (No report was received from the county at the time of publication)
† Laboratory confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
§ILI = Influenza-like illness, fever ≥ 100°F AND sore throat and/or cough in the absence of another known cause.
*ILI surveillance system activity can be assessed using a variety of surveillance systems including sentinel providers, school/workplace absenteeism, long-term care facility (LTCF) surveillance, correctional institution surveillance, hospital emergency department surveillance and laboratory surveillance.
‡Settings include institutional settings (LTCFs, hospitals, prisons, schools, companies) & the community.

VII. REPORTS OF INFLUENZA OR INFLUENZA-LIKE ILLNESS (ILI) OUTBREAKS

During week 13 there were no influenza or influenza-like illness outbreaks reported.

During week 12 there were no influenza or influenza-like illness outbreaks reported.

During week 11 there were no influenza or influenza-like illness outbreaks reported.

During week 10 there was one influenza outbreak reported in a long-term care facility in Brevard County. The Brevard CHD was notified on 03/09/09 of 12 residents and 3 employees suffering from an upper respiratory infection in one wing of the facility. Nasopharyngeal swabs were collected from two residents and one employee with URI and submitted to the state lab in Tampa for analysis. All three were specimens were positive for influenza A by PCR. All positive residents and suspect cases were treated with oseltamivir and amantadine.

County Health Department epidemiologists should report Influenza and ILI outbreaks via EpiCom at: https://fdens.com/vabtrs/GateStart.aspx within the Influenza Forum.

Total influenza or ILI outbreaks reported as of week 13 (03/14/09): 7

VIII. NOTIFIABLE DISEASE REPORTS: INFLUENZA-ASSOCIATED DEATHS AMONG CHILDREN (<18 YEARS) & POST-INFLUENZA INFECTION ENCEPHALITIS

As of the week ending April 04, 2009, there were no influenza-associated deaths among those <18 years of age and/or post-influenza infection encephalitis reported in the state of Florida.

<table>

</tbody>
</table>

*Case reported during week 6 was reclassified as a suspect case. Please note that status of reported cases are subject to change upon receipt of additional information. Influenza-associated deaths among those <18 years of age and/or post-influenza infection encephalitis are reportable; case report forms can be accessed at: http://www.doh.state.fl.us/disease_ctri/epi/topicscrforms.htm.
Florida uses the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE) for syndromic surveillance, which currently collects data from 108* hospitals. These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is influenza-like illness (ILI), which is composed of chief complaints that include the words "influenza" or "flu", or either fever and cough or sore throat. The data are collected on a daily basis from participating hospital emergency departments (ED) across the state. Displayed below are the percentage of ILI visits to local EDs from 2006 to 2009 by week.

*The total number of facilities participating in ESSENCE has increased steadily from 2006 to 2009. In 2007 ESSENCE was implemented as the state syndromic surveillance system. Please note that numbers may change as facility data is updated.
Since the outbreak activity began at the end of December 2003, there have been a total of 417 confirmed human cases and 257 deaths. Cases and deaths have occurred in the following nations: Azerbaijan 8 cases and 5 deaths; Bangladesh 1 case 0 deaths; Cambodia 8 cases and 7 deaths; China 38 cases and 25 deaths; Djibouti 1 case 0 deaths; Egypt 63 cases and 23 deaths; Indonesia 141 cases and 115 deaths; Iraq 3 cases and 2 deaths; Lao People’s Democratic Republic 2 cases and 2 deaths; Myanmar 1 case and 0 deaths; Nigeria 1 case and 1 death; Pakistan 3 cases and 1 death; Thailand 25 cases and 17 deaths; Turkey 12 cases and 4 deaths; and, Vietnam 110 cases and 55 deaths. For a complete analysis and summary of WHO confirmed human cases of H5N1 from 12/1/2003 to current, please visit: http://www.who.int/csr/disease/avian_influenza/ai_timeline/en/index.html

During week 13, the Ministry of Health and Population of Egypt reported three new confirmed human cases of avian influenza. The first case was in a 2 year-old male from Kom Hamada District, Behira Governorate. He developed symptoms on March 27th, 2009 and was admitted to Naaora Fever Hospital on March 30th where he started oseltamivir the same day. The second case was also in a 2 year-old male from the same district and linked to the first case. He developed symptoms on March 31st, 2009 and was admitted to Damanhor Fever Hospital on April 1st where he was started on oseltamivir the same day. Both boys remain in stable condition. Contact with sick and/or dead poultry was noted in both cases prior to illness. The third case was a 6 year-old male from the Qaliobia Governorate. He developed symptoms on March 22nd, 2009 and was admitted to the hospital on March 28th where he started on oseltamivir on April 3rd. He was also exposed to sick and/or dead poultry prior to illness. The case is currently in critical condition.

The Ministry of Health in Viet Nam also reported a new confirmed case of human infection with H5N1 avian influenza virus during week 13. The case is a 3 year-old male from the Dong Thap Province. He developed symptoms on March 12th, 2009 was hospitalized on March 13th, and died on March 19th. Investigations into the source of infection indicate a history of close contact with sick and dead poultry prior to illness.

During week 12, the Ministry of Health and Population of Egypt reported a new confirmed human case of avian influenza. The case was a two and a half year old female from the Qena Governorate. Her symptoms began on March 23rd, 2009 and she was hospitalized at the Qena Fever Hospital on March 24th. The case patient was started on oseltamivir the same day and remains in stable condition. Investigations into the source of infection indicate a history of close contact with sick and dead poultry prior to illness.

During week 11, the Ministry of Health and Population of Egypt reported a new confirmed human case of avian influenza. The case was a 38-year old female from the Assiut Governorate. Her symptoms began on March 14th, 2009. The case was hospitalized at the Assiut Fever Hospital on March 24th. The case patient was started on oseltamivir the same day and remains in stable condition. Investigations into the source of infection indicate a history of close contact with sick and dead poultry prior to illness.

More information about these cases can be found at http://www.who.int/csr/disease/avian_influenza/updates/en/index.html

Human cases of influenza due to infection from novel or pandemic strains are reportable in Florida. Reports should be made to the Department 24/7 upon initial suspicion.
