Week 46: November 14-20, 2010

Summary

The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

National:
- CDC reported low levels of influenza around the country during week 45. The CDC calculated minimal ILI for the state of Florida using Florida's ILINet sentinel surveillance data.

State:
- Influenza-like illness (ILI) activity is low in many of our monitoring systems. This week no counties reported widespread activity, and five counties reported moderate activity.
- ESSENCE ILI data is elevated compared to previous years at this time, especially in the southern regions of Florida.
- Current influenza strains circulating in Florida are primarily influenza A H3, with some 2009 H1N1 and influenza B. Other viruses known to be currently circulating, potentially causing influenza-like illness, include adenovirus, rhinovirus, parainfluenza and RSV. RSV activity is currently elevated, as is expected during the RSV season. RSV can cause severe respiratory illness in infants.
- There was one influenza outbreak reported into EpiCom for week 46. The outbreak was in a long-term care facility (LTC) in Brevard County. County Epidemiology staff were notified of multiple upper respiratory infections in LTC staff and residents. Onset of illness in the LTC was in early November. Two of three specimens gathered from ill residents were PCR-positive for H3 influenza A. Influenza prophylaxis and other control measures were implemented for staff and residents. This is the second outbreak of influenza reported during the 2010-11 influenza season. Patients in previous summer 2010 influenza outbreaks also tested positive for H3 influenza A.

Weekly state influenza activity: Sporadic
Florida is currently reporting Sporadic influenza activity statewide, due to low levels of influenza reflected in many of our surveillance systems and 2 influenza outbreaks reported in previous weeks.

Pediatric influenza Mortality
Influenza-associated deaths among those less than 18 years old are reportable in Florida. There have been NO pediatric influenza deaths reported in the 2010-2011 influenza season. The case definition is available at: http://www.cdc.gov/ncphi/disss/ndss/casedef/Influenza-Associated_current.htm

In this Issue:
Summary 1
NREVSS Respiratory Virus Surveillance 1
Outpatient Influenza-like Illness Surveillance Network (ILINET)-Statewide 2
Outpatient Influenza-like Illness Surveillance Network (ILINET)-Regional 3
ESSENCE Syndromic Surveillance Summary-Statewide 4
ESSENCE Syndromic Surveillance Summary-Regional 5
Florida Bureau of Laboratories Viral Surveillance 6
County Influenza Activity Map 7
County Influenza Activity Trend 8
Florida Pneumonia and Influenza Mortality Surveillance (FPIMSS) 10
The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratory facilities around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of respiratory syncytial virus (RSV), human parainfluenza viruses (HPIV), respiratory and enteric adenoviruses and rotavirus. Florida has over 30 participating laboratory facilities.

**FIGURE 1** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The six respiratory viruses summarized in Figure 1 are:
- RSV
- Parainfluenza 1-3 (HPIV)
- Adenovirus
- Human Metapneumo Virus
- Rhinovirus
- Influenza

**FIGURE 2** shows the percentage of visits for influenza-like illness* reported by ILINet Sentinel Providers statewide.

Statewide ILI activity in ILINet is similar to previous influenza seasons at this time.

**FIGURE 3** shows influenza-like illness (ILI) visit counts reported by ILINet sentinel providers statewide by age group.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.
**The 2009—2010 threshold for moderate activity is calculated from ILINet data. The threshold for moderate activity is the mean percentage of patient visits for ILI during influenza weeks for the previous three seasons plus two standard deviations. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. Due to wide variability in regional level data, it is not appropriate to apply the state baseline to regional data.
^There is no week 53 during the 2006-2007, 2007-2008, and 2009-2010 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.
†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not available through ILINet.
TABLE 2 shows the ILI activity by Regional Domestic Security Task Force (RDSTF) as reported by Florida ILINet physicians for week 46 (ending November 20, 2010).

FIGURE 4 - FIGURE 10 include ILI activity as reported by sentinel physicians for the 2007-2008, 2008-2009, 2009-2010, 2010-2011 seasons.

This week regions 1, 2, 4, and 5 are reporting a percentage of visits due to ILI similar to what has been seen in previous years, while regions 3, 6 and 7 are reporting elevated ILI levels. Please refer to table above for the number of providers reporting for each region. Data should be interpreted with caution due to the low number of providers reporting in some regions. Numbers will change as more data are received.

Percentage of Visits for Influenza-Like Illness Reported by ILINet Sentinel Providers by RDSTF Region, 2007-2008 (Weeks 40-20), 2008-2009 (Weeks 40-39), and 2009-10 (Weeks 40-39) and 2010-2011 (Weeks 40-46) as Reported by 5:00 p.m. November 23, 2010.

Florida uses the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE) for syndromic surveillance, which currently collects data daily from 163 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is influenza-like illness (ILI), which is composed of chief complaints that include the words “influenza” or “flu,” or either fever and cough or sore throat. Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here.

**FIGURE 11** shows ESSENCE data on ILI visits to Emergency Departments as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE is slightly elevated for this time of year compared to previous, non-pandemic seasons.

The majority of the increase in ED visits is occurring in younger age groups.

**FIGURE 12** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that there are increases in ILI activity for younger age groups (<1-19), with smaller increases in the older age groups.

Eighty-six facilities participating in ESSENCE have been able to provide historical admissions data and are included here. The percentage of admissions for ILI is highest in those less than 20 years old, but the small numerators and denominators in this age group result in high variability. Overall, the percentage of admissions due to ILI is very low. These data are based on the patient’s chief complaint when presenting to the emergency department and may not reflect the actual diagnosis.

**FIGURE 13** shows hospital admissions due to ILI as a percentage of all hospital admissions.
Regions 2 and 5 have shown increases in ILI activity in recent weeks. ILI activity in Region 7 has been increasing and is above levels seen in previous non-pandemic seasons. ESSENCE data for region 7 show that the 0-4 and 5-19 age groups are showing the greatest increases over previous seasons.

Map 2: Hospitals Reporting Emergency Department (ED) Data to Florida ESSENCE, November 24, 2010 (N=163)

*There is no week 53 for the 2006-2007, 2007-2008, or 2009-2010 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Table 3 shows the number of specimens tested by the Bureau of Laboratories (BOL), how many are influenza positive, and how many are H1N1 or other influenza subtypes.

FIGURE 21 - FIGURE 22 use BOL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BOL, what proportion of those test positive for influenza, and what subtypes are found for the positive influenza specimens.

In recent weeks the Bureau of Laboratories has had specimens test positive for 2009 H1N1 influenza A, H3 seasonal influenza A, and influenza B unspecified.

Although H3 influenza A has been identified in all recent outbreaks of influenza A, there is no strain of influenza currently dominating in Florida.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date collected, date received by the laboratory, date reported, or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

**FIGURE 21:** Number of Influenza-Positive Specimens Tested by the Florida Bureau of Laboratories (BOL) by Subtype by Lab Event Date* Week 1, 2010 to Week 46, 2010 as Reported in Merlin by 10:00 a.m. November 24, 2010

**FIGURE 22:** Number of Specimens Tested by Florida Bureau of Laboratories (BOL) and Percent Positive for Influenza by Lab Event Date* Week 1, 2010 to Week 46, 2010 as Reported in Merlin by 10:00 a.m. November 24, 2010
As of 5:00 p.m. November 23, 2010 a total of 67 (100%) counties had reported their weekly level of influenza activity. We have achieved 100% reporting for the sixth consecutive week, due to enhanced follow-up with counties. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

FIGURE 23 shows the number of counties reporting localized or widespread activity, 2008-2009, 2009-2010, and 2010-2011.

*there is no week 53 in 2009 or 2010.
† As of Week 40 2010, the influenza activity code categorizations have changed. Please see [http://www.doh.state.fl.us/disease_ctrl/epi/Fla/ActivityDef.htm](http://www.doh.state.fl.us/disease_ctrl/epi/Fla/ActivityDef.htm) for explanations of previous year activity code interpretations.
County influenza activity data is reported to the Bureau of Epidemiology through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 24-33 displayed below reflect a county's assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For the week ending November 20th, 8 counties indicated that activity was decreasing, 39 indicated it was about the same, and 16 indicated that activity was increasing.

**FIGURE 24** shows the assessment of Overall Influenza Activity Trend in County as Reported by County Health Department Flu Coordinators for week 46 as of 5:00 p.m. November 23, 2010.

Definitions for the County Influenza Activity Trends are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html](http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html)

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

- **No or very minimal activity** -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
- **Moderate activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
- **High activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
- **Very high activity** -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm](http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm)

**FIGURE 25 - FIGURE 26** show the activity levels in various facilities by county as reported by county health department flu coordinators for week 46 as of 5:00 p.m. November 23, 2010.
FIGURE 27 - FIGURE 32 show the activity levels in Various Facilities by county as reported by county health department flu coordinators week 46 as of 5:00 p.m. November 23, 2010.
The Florida Department of Health started the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS) in 2006 in order to more timely assess the number of pneumonia and influenza deaths occurring in the state. This system was modeled on the CDC’s 122 cities surveillance system. Each week, the vital statistics office in the 24 most populous counties in Florida manually reviews the death certificates received for the previous week. Any mention of pneumonia or influenza on the death certificate, with certain prescribed exceptions, is counted as a pneumonia or influenza death. These counts, by age group, are then reported to the state via the EpiGateway web-interface.

For week 46 (ending November 20, 2010) there were:
- 131 deaths reported
- Upper bound of 95% confidence interval for prediction: 167 deaths
- NO excess deaths

The majority of the deaths are in those aged 75 years and older.

24 of 24 counties reported data for week 46.

**FIGURE 35** shows Pneumonia and Influenza Deaths for 24 Florida Counties, week 1, 2008 - week 45, 2010 as reported to FPIMSS by 5:00 p.m. November 23, 2010.

**FIGURE 36** shows the reported count of pneumonia and influenza deaths for 24 Florida counties, the number of deaths predicted using the Serfling Model, and the upper bound of the 95% confidence interval for this prediction.
