**Summary**

The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

**National:**
- CDC reported low levels of influenza around the country during week 50. The CDC calculated minimal ILI for the state of Florida using Florida’s ILINet sentinel surveillance data.

**State:**
- Influenza-like illness (ILI) activity is moderate and increasing in many of our monitoring systems. This week no counties reported widespread activity, and ten counties reported moderate activity. Thirty-three counties reported increasing influenza activity. Week 51 has the highest number of counties reporting moderate and increasing influenza activity so far this season.
- ESSENCE and ILINet ILI data are elevated compared to previous years at this time, especially in the southern and central regions of Florida.
- Current influenza strains circulating in Florida are primarily influenza A H3, with some 2009 H1N1 and influenza B. Other viruses known to be currently circulating, potentially causing influenza-like illness, include adenovirus, rhinovirus, parainfluenza and RSV. RSV activity is currently elevated, as is expected during the RSV season. RSV can cause severe respiratory illness in infants.
- There were no influenza or ILI outbreaks reported in week 51. There have been 3 previous outbreaks in the 2010-11 influenza season, in a long-term care facility, a skilled nursing facility, and a school, respectively.

**Weekly state influenza activity: Regional**

Florida is currently reporting Regional influenza activity statewide, due to moderate influenza activity levels reported out of south and central Florida, continued high percent positive for influenza specimens, and elevated and increasing ILI levels in ESSENCE and ILINet.

**Pediatric influenza Mortality**

Influenza-associated deaths among those less than 18 years old are reportable in Florida. There have been NO pediatric influenza deaths reported in the 2010-2011 influenza season. The case definition is available at: [http://www.cdc.gov/ncphi/disss/nndss/casedef/Influenza-Associated_current.htm](http://www.cdc.gov/ncphi/disss/nndss/casedef/Influenza-Associated_current.htm)

**Weekly state influenza activity: Regional**

Florida is currently reporting Regional influenza activity statewide, due to moderate influenza activity levels reported out of south and central Florida, continued high percent positive for influenza specimens, and elevated and increasing ILI levels in ESSENCE and ILINet.

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratory facilities around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of respiratory syncytial virus (RSV), human parainfluenza viruses (HPIV), respiratory and enteric adenoviruses and rotavirus. Florida has over 30 participating laboratory facilities.

**FIGURE 1** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The six respiratory viruses summarized in Figure 1 are:
- RSV
- Parainfluenza 1-3 (HPIV)
- Adenovirus
- Human Metapneumo Virus
- Rhinovirus
- Influenza

**ILINET Influenza-like Illness-Statewide**

**FIGURE 2** shows the percentage of visits for influenza-like illness* reported by ILINet Sentinel Providers statewide.

Statewide ILI activity in ILINet is slightly elevated over previous influenza seasons at this time.

**FIGURE 3** shows influenza-like illness (ILI) visit counts reported by ILINet sentinel providers statewide by age group.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

**The 2009—2010 threshold for moderate activity is calculated from ILINet data. The threshold for moderate activity is the mean percentage of patient visits for ILI during influenza weeks for the previous three seasons plus two standard deviations. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. Due to wide variability in regional level data, it is not appropriate to apply the state baseline to regional data.

^There is no week 53 during the 2006-2007, 2007-2008, and 2009-2010 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not available through ILINet.
TABLE 2 shows the ILI activity by Regional Domestic Security Task Force (RDSTF) as reported by Florida ILINet physicians for week 51 (ending December 25, 2010).

FIGURE 4 - FIGURE 10 include ILI activity as reported by sentinel physicians for the 2007-2008, 2008-2009, 2009-2010, 2010-2011 seasons.

Regions 2, 3, 5, 6 and 7 are showing large continual increases in ILI. Region 1 and 4 are showing a slight increase in ILI from the previous week. Refer to table above for the number of providers reporting for each region. Data should be interpreted with caution due to the low number of providers reporting in some regions. Numbers will change as more data are received.

Percentage of Visits for Influenza-Like Illness Reported by ILINet Sentinel Providers by RDSTF Region, 2007-2008 (Weeks 40-20), 2008-2009 (Weeks 40-39), and 2009-10 (Weeks 40-39) and 2010-2011 (Weeks 40-51) as Reported by 5:00 p.m. December 28, 2010.
Florida uses the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE) for syndromic surveillance, which currently collects data daily from 163 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is influenza-like illness (ILI), which is composed of chief complaints that include the words "influenza" or "flu," or either fever and cough or sore throat. Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here.

**FIGURE 11** shows ESSENCE data on ILI visits to Emergency Departments as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE is elevated for this time of year compared to previous, non-pandemic seasons.

The majority of the increase in ED visits is occurring in younger age groups.

**FIGURE 12** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that there are increases in ILI activity for younger age groups (<1-19), with smaller increases in the older age groups.

Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here. The percentage of admissions for ILI is highest in those less than 20 years old, but the small numerators and denominators in this age group result in high variability. Overall, the percentage of admissions due to ILI is very low. These data are based on the patient’s chief complaint when presenting to the emergency department and may not reflect the actual diagnosis.

**FIGURE 13** shows hospital admissions due to ILI as a percentage of all hospital admissions.

The overall activity for influenza-like illness reported in ESSENCE is elevated for this time of year compared to previous, non-pandemic seasons.
Regions 1-7 all showed sharp increases in ILI activity in the past weeks, greater than non-pandemic years.

*There is no week 53 for the 2006-2007, 2007-2008, or 2009-2010 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Table 3 shows the number of specimens tested by the Bureau of Laboratories (BOL), how many are influenza positive, and how many are H1N1 or other influenza subtypes.

**FIGURE 21 - FIGURE 22** use BOL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BOL, what proportion of those test positive for influenza, and what subtypes are found for the positive influenza specimens.

In recent weeks the Bureau of Laboratories has had specimens test positive for 2009 H1N1 influenza A, H3 seasonal influenza A, and influenza B unspecified. Although H3 influenza A has been identified in all recent outbreaks of influenza A, there is no strain of influenza currently dominating in Florida. A selection of specimens tested at the Bureau of Laboratories are sent to the CDC on a regular basis for pyrosequencing, which determines the genetic make-up of those viruses.

All twelve of the H3 specimens that have been forwarded to CDC have come back as "A/PERTH/16/2009-LIKE (H3N2)". Four out of five influenza B specimens are "B/BRISBANE/60/2008-LIKE" and 6 out of 6 H1N1 specimens have come back as "A/CALIFORNIA/07/2009-LIKE (H1N1)". All three of these strains are extremely close to the viruses against which the vaccine was made this year.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date collected, date received by the laboratory, date reported, or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

As of 5:00 p.m. December 28, 2010 a total of 67 (100%) counties had reported their weekly level of influenza activity. We have achieved 100% reporting for the twelfth consecutive week, due to enhanced follow-up with counties. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Map 3: Weekly County Influenza Activity for Week 51 as Reported by 5:00 p.m. December 28, 2010

No counties reported widespread influenza activity

**FIGURE 23** shows the number of counties reporting localized or widespread activity, 2008-2009, 2009-2010, and 2010-2011.
County influenza activity data is reported to the Bureau of Epidemiology through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 24-33 displayed below reflect a county's assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For the week ending December 25th, no counties indicated that activity was decreasing, 21 indicated it was about the same, and 41 indicated that activity was increasing.

**FIGURE 24** shows the assessment of Overall Influenza Activity Trend in County as Reported by County Health Department Flu Coordinators for week 51 as of 5:00 p.m. December 28, 2010.

Definitions for the County Influenza Activity Trends are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html](http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html)

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

- **No or very minimal activity** -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
- **Moderate activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
- **High activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
- **Very high activity** -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm](http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm)

**FIGURE 25** - **FIGURE 26** show the activity levels in various facilities by county as reported by county health department flu coordinators for week 51 as of 5:00 p.m. December 28, 2010.
FIGURE 27 - FIGURE 32 show the activity levels in various Facilities by county as reported by county health department flu coordinators week 51 as of 5:00 p.m. December 28, 2010.
The Florida Department of Health started the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS) in 2006 in order to more timely assess the number of pneumonia and influenza deaths occurring in the state. This system was modeled on the CDC’s 122 cities surveillance system. Each week, the vital statistics office in the 24 most populous counties in Florida manually reviews the death certificates received for the previous week. Any mention of pneumonia or influenza on the death certificate, with certain prescribed exceptions, is counted as a pneumonia or influenza death. These counts, by age group, are then reported to the state via the EpiGateway web-interface.

For week 51 (ending December 25, 2010) there were:
- 93 deaths reported
- Upper bound of 95% confidence interval for prediction: 173 deaths
- NO excess deaths

The majority of the deaths are in those aged 75 years and older.

23 of 24 counties reported data for week 51.

**FIGURE 35** shows Pneumonia and Influenza Deaths in 4 Age Groups for 24 Florida Counties, Week 1, 2009-Week 51, 2010 as Reported to FPIMSS by 5:00 p.m. December 28, 2010.

**FIGURE 36** shows the reported count of pneumonia and influenza deaths for 24 Florida counties, the number of deaths predicted using the Serfling Model, and the upper bound of the 95% confidence interval for this prediction.

*There is no week 53 for the 2006-2007, 2007-2008, or 2009-2010 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.*
