Summary

The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

National:
- The Centers for Disease Control and Prevention (CDC) reported low levels of influenza nationwide during week 13. Influenza activity has been generally decreasing nationwide. The CDC calculated minimal influenza-like illness (ILI) intensity for the state of Florida using Florida’s ILINet sentinel surveillance data.

State:
- ILI activity is low and decreasing in many of our monitoring systems. No counties currently report widespread or moderate influenza activity. No counties report increasing influenza activity, and 40 counties report decreasing activity.
- ESSENCE and ILINet ILI activity levels are near previous non-pandemic seasons at this time in most regions of Florida.
- Current influenza strains circulating in Florida are influenza A H3, 2009 H1N1 and influenza B. In recent weeks, the overall number of specimens submitted and the percent positive for influenza have decreased. Other viruses known to be currently circulating, potentially causing ILI, include adenovirus, rhinovirus, parainfluenza, and respiratory syncytial virus (RSV).
- There were no influenza, ILI, or respiratory disease outbreaks reported in week 14. There have been 25 influenza or ILI outbreaks and four respiratory outbreaks reported in the 2010-11 influenza season. Most of these outbreaks have been in nursing homes and long-term care facilities. Influenza A H3 or 2009 H1N1 have been implicated in PCR confirmed outbreaks.

Weekly state influenza activity: Sporadic

Florida is currently reporting Sporadic influenza activity statewide, due to plateaued or declining activity levels in all regions of Florida as shown in our influenza surveillance systems. This activity level represents the statewide spread of influenza, and is not a measure of flu intensity.

Pediatric influenza Mortality
No pediatric influenza mortalities were reported in week 14. There have been two pediatric influenza mortalities reported in the 2010-11 season. Influenza-associated deaths among those less than 18 years old are reportable in Florida.

Weekly state influenza activity:
Sporadic

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratory facilities around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of RSV, human parainfluenza viruses, human metapneumovirus (HMPV), respiratory and enteric adenoviruses and rotavirus. Florida has over 30 participating laboratory facilities.

**FIGURE 1** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The six respiratory viruses summarized in Figure 1 are:
- RSV
- Parainfluenza 1-3
- Adenovirus
- HMPV
- Rhinovirus
- Influenza

Recent HMPV results are from a recently added lab that has not contributed historical data. These data should not be interpreted as an increase over background levels.

**ILINET Influenza-like Illness-Statewide**

**FIGURE 2** shows the percentage of visits for influenza-like illness* reported by ILINet Sentinel Providers statewide.

ILI activity is well below the moderate threshold and at levels near previous non-pandemic influenza seasons at this time.

**FIGURE 3** shows influenza-like illness (ILI) visit counts reported by ILINet sentinel providers statewide by age group.

ILI visit counts are declining in all age groups.
TABLE 2 shows the ILI activity by Regional Domestic Security Task Force (RDSTF) as reported by Florida ILINet physicians for week 14 (ending April 9, 2011).

FIGURE 4 - FIGURE 10 include ILI activity as reported by sentinel physicians for the 2007-2008, 2008-2009, 2009-2010, 2010-2011 seasons.

Region 1 is reporting no ILI activity while regions 2, 4 and 5 continue to decline. Region 6 is decreasing in ILI activity after an increase in previous weeks. Regions 3 and 7 report increases in ILI activity. Regions 6 and 7 remain at levels higher than previous years. Data should be interpreted with caution due to low numbers of providers reporting in some regions. Numbers will change as more data are received.

Percentage of Visits for Influenza-Like Illness Reported by ILINet Sentinel Providers by RDSTF Region, 2007-2008 (Weeks 40-20), 2008-2009 (Weeks 40-39), and 2009-10 (Weeks 40-39) and 2010-2011 (Weeks 40-14) as Reported by 5:00 p.m. April 12, 2011.
Florida uses ESSENCE for syndromic surveillance, which currently collects data daily from 163 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words "influenza" or "flu," or either fever and cough or sore throat. Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here.

**FIGURE 11** shows ESSENCE data on ILI visits to EDs as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE is similar to levels seen during the same time period in non-pandemic years.

**FIGURE 12** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that ILI activity has increased in the youngest and oldest age groups in week 14.

**FIGURE 13** shows hospital admissions due to ILI as a percentage of all hospital admissions.

Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here. The percentage of admissions for ILI is highest in those less than 20 years old, but the small numerators and denominators in this age group result in high variability. Overall, the percentage of admissions due to ILI is very low. These data are based on the patient's chief complaint when presenting to the emergency department and may not reflect the actual diagnosis.
ILI activity in ESSENCE increased in regions 1-5 and 7. ILI activity decreased in region 6. All regions are showing activity near or below that of previous non-pandemic influenza seasons at this time.

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Bureau of Laboratories Viral Surveillance

**FIGURE 21 - FIGURE 22** use BOL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BOL, what proportion of those test positive for influenza, and what subtypes are found for the positive influenza specimens.

**Table 3** shows the number of specimens tested by the Bureau of Laboratories (BOL), how many are influenza positive, and how many are H1N1 or other influenza subtypes.

In recent weeks the Bureau of Laboratories has had specimens test positive for 2009 H1N1 influenza A, H3 seasonal influenza A, and influenza B unspecified.

Current influenza strains circulating in Florida are influenza A H3, 2009 H1N1 and influenza B. Number of specimens submitted and percent positive for flu have decreased in recent weeks.

A subset of BOL influenza specimens is forwarded to CDC for further strain analysis. Of these specimens, 57 of 57 influenza A specimens and 15 of 16 influenza B specimens matched the strains included in the 2010-11 influenza vaccine.

In week 13 there were no influenza, ILI, or respiratory disease outbreaks reported into EpiCom.

A total of **twenty-five** influenza or ILI outbreaks and **four** respiratory disease outbreaks have been reported into EpiCom in the 2010-11 influenza season. Influenza A H3 or 2009 H1N1 influenza A have been isolated in PCR-confirmed influenza outbreaks.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date collected, date received by the laboratory, date reported, or date inserted.*

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

For instructions on how to use the Flu Lab Report, please see the Guide to Flu Lab Report on the Bureau of Epidemiology website:

Influenza and ILI Outbreaks

In week 13 there were no influenza, ILI, or respiratory disease outbreaks reported into EpiCom.

A total of **twenty-five** influenza or ILI outbreaks and **four** respiratory disease outbreaks have been reported into EpiCom in the 2010-11 influenza season. Influenza A H3 or 2009 H1N1 influenza A have been isolated in PCR-confirmed influenza outbreaks.
County Influenza Activity

As of 8:00 April 13, 2011 a total of 67 (100%) counties had reported their weekly level of influenza activity. We have achieved 100% reporting for the 26th consecutive week, due to enhanced follow-up with counties. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Map 3: Weekly County Influenza Activity for Week 14 as Reported by 8:00 a.m. April 13, 2011

No counties report widespread or moderate activity.

FIGURE 23 shows the number of counties reporting localized or widespread activity, 2008-2009, 2009-2010, and 2010-2011.

FIGURE 23: Number of Counties Reporting Moderate (Localized) or Widespread Activity, 2008-2009 (Weeks 40-39), 2009-2010 (Weeks 40-20), and 2010-2011 (Weeks 40-14) as Reported by 8:00 a.m. April 13, 2011

* There is no week 53 during the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
† As of Week 40 2010, the influenza activity code categorizations have changed. Please see [http://www.doh.state.fl.us/disease_ctr/epi/FluActivityDef.htm](http://www.doh.state.fl.us/disease_ctr/epi/FluActivityDef.htm) for explanations of previous year activity code interpretations.
FIGURE 24 shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 14 as of 8:00 a.m. April 13, 2011.

Definitions for the County Influenza Activity Trends are available at: http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

County settings assessment guides are available at: http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm

FIGURE 25 - FIGURE 26 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 14 as of 8:00 a.m. April 13, 2011.
FIGURE 27 - FIGURE 32 show the activity levels in various Facilities by county as reported by county health department flu coordinators week 14 as of 8:00 a.m. April 13, 2011.
Florida Pneumonia and Influenza Mortality Surveillance

FDOH started the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS) in 2006 in order to more timely assess the number of pneumonia and influenza deaths occurring in the state. This system was modeled on the CDC’s 122 Cities Mortality Reporting System. Each week, the vital statistics office in the 24 most populous counties in Florida manually reviews the death certificates received for the previous week. Any mention of pneumonia or influenza on the death certificate, with certain prescribed exceptions, is counted as a pneumonia or influenza death. These counts, by age group, are then reported to the state via the EpiGateway web-interface.

For week 14 (ending April 9) there were:
- 157 deaths reported
- Upper bound of 95% confidence interval for prediction: 203 deaths
- No excess deaths

The majority of the deaths are in those aged 75 years and older. Mortality increased in the 45-74 and 75+ age groups in week 14.

All 24 participating counties reported data for week 14.

**FIGURE 35** shows Pneumonia and Influenza Deaths in 4 Age Groups for 24 Florida Counties, Week 1, 2009-Week 14, 2011 as Reported to FPIMSS by 5:00 p.m. April 12, 2011

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**FIGURE 36** shows the reported count of pneumonia and influenza deaths for 24 Florida counties, the number of deaths predicted using the Serfling Model, and the upper bound of the 95% confidence interval for this prediction.
