Summary

The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

NOTE: Week 20 is the final week of the 2010-11 influenza season. An abbreviated version of the Florida Flu Review will be published biweekly during the summer months.

National:
- The Centers for Disease Control and Prevention (CDC) reported minimal levels of influenza nationwide during week 19. The CDC calculated minimal influenza-like illness (ILI) intensity for the state of Florida using Florida’s ILINet sentinel surveillance data.
- ILI activity is low and decreasing in many of our monitoring systems. No counties currently report moderate or widespread activity. One county reports increasing influenza activity, and 32 counties report decreasing activity.
- ESSENCE and ILINet ILI activity levels are near previous non-pandemic seasons at this time in most regions of Florida.
- In week 20 there were no positive flu results from the state laboratory. In recent weeks, the overall number of specimens submitted and the percent positive for influenza have decreased. Other viruses known to be currently circulating, potentially causing ILI, include adenovirus, rhinovirus, parainfluenza, and respiratory syncytial virus (RSV).
- No outbreaks of ILI or influenza were reported in week 20. There have been 26 influenza or ILI outbreaks and four respiratory outbreaks reported in the 2010-11 influenza season. Most of these outbreaks have been in nursing homes and long-term care facilities. Influenza A H3 or 2009 H1N1 have been implicated in PCR confirmed outbreaks.

Weekly state influenza activity: Sporadic
Florida is currently reporting Sporadic influenza activity statewide, due to plateaued or declining activity levels in all regions of Florida as shown in our influenza surveillance systems. This activity level represents the statewide spread of influenza, and is not a measure of flu intensity.

Pediatric influenza Mortality
No pediatric influenza mortalities were reported in week 20. There have been two pediatric influenza mortalities reported in the 2010-11 season. Influenza-associated deaths among those less than 18 years old are reportable in Florida.

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratory facilities around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of RSV, human parainfluenza viruses, human metapneumo virus (HMPV), respiratory and enteric adenoviruses, and rotavirus. Florida has over 30 participating laboratory facilities.

**FIGURE 1** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The six respiratory viruses summarized in Figure 1 are:
- RSV
- Parainfluenza 1-3
- Adenovirus
- HMPV
- Rhinovirus
- Influenza

Recent HMPV results are from a recently added lab that has not contributed historical data. These data should not be interpreted as an increase over background levels.

**FIGURE 2** shows the percentage of visits for ILI* reported by ILINet Sentinel Providers statewide.

ILI activity is well below the moderate threshold and at levels near previous non-pandemic influenza seasons at this time.

**FIGURE 3** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

ILI visit counts are declining in all age groups.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

**The 2010—2011 threshold for moderate activity is calculated from ILINet data. The threshold for moderate activity is the mean percentage of patient visits for ILI during influenza weeks for the previous three seasons plus two standard deviations. Only weeks with 10% or greater of laboratory specimens testing positive are included in the calculation. Due to wide variability in regional level data, it is not appropriate to apply the state baseline to regional data.

^There is no week 53 during the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not available through ILINet.

TABLE 2 shows the ILI activity by Regional Domestic Security Task Force (RDSTF) as reported by Florida ILINet physicians for week 20 (ending May 21, 2011).

FIGURE 4 - FIGURE 10 include ILI activity as reported by sentinel physicians for the 2007-2008, 2008-2009, 2009-2010, 2010-2011 seasons.

ILI activity has increased in regions 5 and 6. Activity in regions 1-4 and 7 remains low. All regions report ILI activity similar to previous years at this time. Data should be interpreted with caution due to low numbers of providers reporting in some regions. Numbers will change as more data are received.

Percentage of Visits for Influenza-Like Illness Reported by ILINet Sentinel Providers by RDSTF Region, 2007-2008 (Weeks 40-20), 2008-2009 (Weeks 40-39), and 2009-10 (Weeks 40-39) and 2010-2011 (Weeks 40-20) as Reported by 5:00 p.m. May 24, 2011.
Florida uses ESSENCE for syndromic surveillance, which currently collects data daily from 163 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or either fever and cough or sore throat.

**FIGURE 11** shows ESSENCE data on ILI visits to EDs as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE is similar to levels seen during the same time period in non-pandemic years.

**FIGURE 12** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that ILI activity is declining in all age groups.

**FIGURE 13** shows hospital admissions due to ILI as a percentage of all hospital admissions.

Ninety-five facilities participating in ESSENCE have been able to provide historical admissions data and are included here. The percentage of admissions for ILI is highest in those less than 20 years old, but the small numerators and denominators in this age group result in high variability. Overall, the percentage of admissions due to ILI is very low. These data are based on the patient’s chief complaint when presenting to the emergency department and may not reflect the actual diagnosis.
ILI activity in ESSENCE increased in regions 1, 2 and 5. ILI activity decreased or plateaued in regions 3, 4, 6 and 7. All regions are showing activity near or below that of previous non-pandemic influenza seasons at this time.

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Table 3 shows the number of specimens tested by the Bureau of Laboratories (BOL), how many are influenza positive, and how many are H1N1 or other influenza subtypes.

In recent weeks the BOL has had specimens test positive for 2009 H1N1 influenza A, H3 seasonal influenza A, and influenza B unspecified.

Current influenza strains circulating in Florida are influenza A H3, 2009 H1N1, and influenza B. Number of specimens submitted and percent positive for flu have decreased in recent weeks.

A subset of BOL influenza specimens is forwarded to CDC for further strain analysis. Of these specimens, 57 of 57 influenza A specimens and 15 of 16 influenza B specimens matched the strains included in the 2010-11 influenza vaccine.

In week 20 there were no influenza or ILI outbreaks reported into EpiCom.

A total of 26 influenza or ILI outbreaks and four respiratory disease outbreaks have been reported into EpiCom in the 2010-11 influenza season. Influenza A H3 or 2009 H1N1 influenza A have been isolated in PCR-confirmed influenza outbreaks.
As of 8:00 a.m. May 25, 2011 a total of 67 (100%) counties had reported their weekly level of influenza activity. We have achieved 100% reporting for the 31st consecutive week, due to enhanced follow-up with counties. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Map 3: Weekly County Influenza Activity for Week 20 as Reported by 10:00 a.m. May 25, 2011

No counties report widespread or moderate activity.

**FIGURE 23** shows the number of counties reporting localized or widespread activity, 2008-2009, 2009-2010, and 2010-2011.
County influenza activity data is reported to the Bureau of Epidemiology through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 24-33 displayed below reflect a county’s assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 20, 32 counties indicated that activity was decreasing, 31 indicated it was about the same, and one indicated that activity was increasing.

**FIGURE 24** shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 20 as of 8:00 a.m. May 25, 2011.

Definitions for the County Influenza Activity Trends are available at: http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.

Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.

High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.

Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm

**FIGURE 25 - FIGURE 26** show the activity levels in various facilities by county as reported by county health department flu coordinators for week 20 as of 8:00 a.m. May 25, 2011.
**FIGURE 27 - FIGURE 32** show the activity levels in various facilities by county as reported by county health department flu coordinators week 20 as of 8:00 a.m. May 25, 2011.
Florida Pneumonia and Influenza Mortality Surveillance

FDOH started the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS) in 2006 in order to more timely assess the number of pneumonia and influenza deaths occurring in the state. This system was modeled on the CDC’s 122 Cities Mortality Reporting System. Each week, the vital statistics office in the 24 most populous counties in Florida manually reviews the death certificates received for the previous week. Any mention of pneumonia or influenza on the death certificate, with certain prescribed exceptions, is counted as a pneumonia or influenza death. These counts, by age group, are then reported to the state through EpiGateway.

For week 21 (ending May 21) there were:
- 121 deaths reported
- Upper bound of 95% confidence interval for prediction: 183 deaths
- No excess deaths

The majority of the deaths are in those aged 75 years and older. All 24 participating counties reported data for week 20.

**FIGURE 35** shows Pneumonia and Influenza Deaths in 4 Age Groups for 24 Florida Counties, Week 1, 2009-Week 20, 2011 as Reported to FPIMSS by 5:00 p.m. May 24, 2011

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**FIGURE 36** shows the reported count of pneumonia and influenza deaths for 24 Florida counties, the number of deaths predicted using the Serfling Model, and the upper bound of the 95% confidence interval for this prediction.
