The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

**State:**
Influenza and Influenza-like illness (ILI) activity in Florida is low in most FDOH surveillance systems. ESSENCE emergency department data show elevated percent ILI in some regions compared to previous years at this time. Due to an ESSENCE system update, ED ILI data are only current up to 4:00pm, June 19th 2012. Two counties report moderate activity.

- In week 25, 10 specimens tested PCR-positive for influenza at the state lab. Eight specimens tested positive for influenza B. Two specimens tested positive for influenza A H3. In recent weeks, influenza B has been the most common strain identified by the state lab. Other viruses known to be currently circulating, potentially causing ILI, include adenovirus, rhinovirus, parainfluenza, and respiratory syncytial virus (RSV).

**NREVSS Respiratory Virus Surveillance**

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratory facilities around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of RSV, human parainfluenza viruses, human metapneumo virus (HMPV), respiratory and enteric adenoviruses, and rotavirus. Twenty-eight facilities reported in week 25.

**FIGURE 1** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The 6 respiratory viruses summarized in Figure 1 are:
- RSV
- Parainfluenza 1-3
- Adenovirus
- HMPV
- Rhinovirus
- Influenza
ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 110 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submitting ILI specimens to the BOL for confirmatory testing.

**Figure 2** shows the percentage of visits for ILI* reported by ILINet Sentinel Providers statewide.

ILI percent positive remains low and similar to other non-pandemic seasons at this time. **ILINet Provider reporting declines in the summer months. Figures will be updated as new data are received.**

59 of 110 ILINet Sentinels have reported visit counts as of 11:00 a.m., June 27, 2012.

13 of 16 ILINet Super-Sentinels have reported visit counts as of 11:00 a.m., June 27, 2012.

**Figure 3** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

ILI visit counts are decreasing in the 0-64 age group in week 25. ILI visit counts are increasing in the 65+ age group in week 25.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

^There is no week 53 during the 2009-2010, 2010-2011, and 2011-12 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Influenza and ILI Outbreaks**

In week 25 there were **no** influenza or ILI outbreaks reported via EpiCom.  

Three influenza or ILI outbreaks were reported via EpiCom in summer 2011-12.
Florida uses ESSENCE for syndromic surveillance, which currently collects data daily from 174 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain fever plus cough and/or sore throat.

Due to an ESSENCE system update, influenza-like illness visits to emergency departments, hospital admission and hospital discharge disposition data are not available for week 26 and are current up to 4:30pm, Tuesday, June 19th 2012. Updated figures will be published as they become available at http://www.doh.state.fl.us/disease_ctrl/epi/htopics/flu/2012/index.html.

FIGURE 4 shows ESSENCE data on ILI visits to EDs as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE is elevated compared to levels seen in previous non-pandemic seasons at this time.

FIGURE 5 shows percentage of ILI among all ED visits by age group.

Age-specific trends show that percent ILI in the 0-54 age group is flat and percent ILI is decreasing in the 55+ age group in week 24.

One hundred five ESSENCE participating facilities are able to provide discharge disposition data for their ED visits going back to week 40, 2010. Using this information, the percent of ED visits for ILI that result in hospitalization can be calculated. The highest percentage of admissions is in the 55+ years old age group. The low number of visits in the 55+ age group causes variability in the ILI admission percentage from week to week.

FIGURE 6 shows the percentage of ED visits for ILI that resulted in hospitalization, by age group.
Due to an ESSENCE system update, influenza-like-illness visits to emergency departments, hospital admission and hospital discharge disposition data are not available for week 26 and are current up to 4:30pm, Tuesday, June 19th, 2012. Updated figures will be published as they become available at http://www.doh.state.fl.us/disease_ctr/epi/topics/flu/2012/index.html.

ILI activity in ESSENCE is elevated over previous years at this time in Regions 3, 5 and 7.

FIGURE 7 - FIGURE 13 describe ED chief complaint data from ESSENCE by Regional Domestic Security Task Force (RDSTF).

*There is no week 53 for the 2009-2010, 2010-2011 and 2011-2012 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Bureau of Laboratories Viral Surveillance

Small numbers of influenza specimens submitted to BOL tested positive for influenza A H3, 2009 H1N1, and influenza B. Influenza B has been the most common strain detected by BOL in recent weeks.

Table 2 shows the number of specimens tested by the Bureau of Laboratories (BOL), how many are influenza positive, and how many are H1N1 or other influenza subtypes.

FIGURE 14 - FIGURE 15 use BOL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BOL, what proportion of those test positive for influenza, and what subtypes are found for the positive influenza specimens.

County Influenza Activity

As of 11:00 a.m. June 27, 2012 a total of 35 (52%) counties had reported their weekly level of influenza activity. During the summer months, counties have the option of continuing to report influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Map 2: Weekly County Influenza Activity for Week 25 as Reported by 11:00 a.m. June 27, 2012

A total of 35 counties report influenza activity in week 25. Most reporting counties reported no or mild activity. Two counties report moderate activity.
County influenza activity data is reported to the Bureau of Epidemiology through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 16-25 displayed below reflect a county's assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 25, seven counties indicated that activity was decreasing, twenty-two indicated it was about the same as previous weeks, and three indicated that activity was increasing.

**FIGURE 16** shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 25 as of 11:00 a.m. June 27, 2012.

Definitions for the County Influenza Activity Trends are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html](http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html)

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.

Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.

High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.

Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm](http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm)
