The Florida Department of Health (FDOH) monitors multiple surveillance systems such as the Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL), the Florida Pneumonia and Influenza Mortality Surveillance System (FPIMSS), notifiable disease reports (Merlin), EpiCom, and Florida ILINet in order to track influenza activity in the state.

National:
- In 2012, 307 people in 11 states have been infected with a variant strain of influenza A H3N2, also known as H3N2v. The H3N2v strain originates from influenza that circulates in pigs. Nearly all persons infected with H3N2v have reported direct or indirect contact with swine. Most cases have occurred in children; one death has been reported in an adult with underlying health conditions. No cases of H3N2v infection have been reported in Florida.

State:
- After experiencing elevated influenza-like illness (ILI) levels statewide during the summer months, ESSENCE-FL emergency department ILI levels in some regions are above expected levels for this time of year. The most elevated levels in ESSENCE-FL ILI are currently in Regions 1, and 5. Six counties report moderate influenza activity in week 46. There were no ILI outbreaks reported into EpiCom in week 46.
- In week 46, fifteen specimens tested PCR positive for influenza B, eight specimens tested PCR positive for influenza A,H3 and another four tested PCR positive for influenza A unspecified at the state public health laboratory. Respiratory syncytial virus (RSV) activity is elevated above previous years at this time although recent increases are in keeping with seasonal trends.

Weekly state influenza activity: Sporadic
Florida is currently reporting Sporadic influenza activity statewide, due to low activity levels in all regions of Florida as shown in our influenza surveillance systems. This activity level represents the statewide spread of influenza, and is not a measure of flu intensity, morbidity, or mortality.

Pediatric Influenza-Associated Mortality
Pediatric influenza-associated deaths among those less than 18 years old are reportable in Florida. No influenza-associated pediatric deaths have been reported so far in the 2012-2013 influenza season.

ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 110 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submitting ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing. For this season, the Bureau of Epidemiology (BOE) has designated 16 of these ILINet physicians’ offices as Super-Sentinels. These Super-Sentinels will receive more active follow-up from BOE and participating county health departments, with the goal of increasing data quality and surveillance specimen submission. Complete laboratory and visit data from Florida ILINet Super-Sentinels will be presented in the Florida Flu Review in future weeks.

**FIGURE 1** shows the percentage of visits for ILI* reported by ILINet Sentinel Providers statewide. ILI percent positive remains low and similar to other non-pandemic seasons at this time.

- 66 of 110 ILINet Sentinels reported visit counts as of 11:30 a.m., November 21, 2012.
- 11 of 15 ILINet Super-Sentinels reported visit counts as of 11:30 a.m., November 21, 2012.

**Note:** In response to several states’ identifying recent infections due to H3N2v, FDOH enhanced viroligic surveillance. ILINet Sentinels have been advised to submit more specimens to BPHL from children under age 18. BPHL is able to detect presumptive positives for both seasonal and novel influenza viruses through routine testing. **No cases of variant H3N2 influenza A have been reported in Florida.** Detailed guidance documents have been sent to sentinel sites and county health departments.

**FIGURE 2** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

ILI visit counts are decreasing in the 0-4, 5-24 and 65+ age groups in week 46. ILI visit counts are increasing in the 25-64 year old age groups in week 46.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not available through ILINet.
Florida uses ESSENCE-FL for syndromic surveillance, which currently collects data daily from 174 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain fever plus cough or sore throat.

**FIGURE 3** shows ESSENCE-FL data on ILI visits to EDs as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE-FL is similar to levels seen during the 2010-2011 season at this time, but higher than 2011-2012 season.

**FIGURE 4** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that percent ILI in the 0-19 and 55+ age groups is increasing for week 46. Percent ILI is flat in the 20-54 year old age group.

One hundred five ESSENCE-FL participating facilities are able to provide discharge disposition data for their ED visits going back to week 40, 2010. Using this information, the percent of ED visits for ILI that result in hospitalization can be calculated. The highest percentage of admissions is in the 55+ years old age group. The low number of visits in the 55+ age group causes variability in the ILI admission percentage from week to week.

**FIGURE 5** shows the percentage of ED visits for ILI that resulted in hospitalization, by age group.
ILI activity in ESSENCE-FL is elevated in Regions 1 and 5. ILI levels in all other regions are at or below levels seen in previous non-pandemic seasons at this time.
Small numbers of influenza specimens submitted to BPHL tested positive for influenza A H3, 2009 H1N1, and influenza B.

Influenza B has been the most common strain detected by BPHL in recent weeks.

In addition to PCR testing, BPHL also uses culture testing for influenza specimens, including those positive for influenza B.

There are two distinct antigenic lineages of influenza B, known as Victoria and Yamagata. Both have circulated in Florida in the past year.

This season, 8 specimens have tested positive for influenza B, Victoria lineage and one specimen has tested positive for influenza B, Yamagata lineage. Last year’s 2011-12 vaccine included a Victoria lineage virus, while this year’s 2012-2013 vaccine includes a Yamagata lineage virus. Influenza viruses that circulate at the beginning of the flu season may be different than those that circulate later in the year, and these specimens represent a very small sample of statewide influenza activity. Not all flu positive specimens receive culture testing. FDOH will continue to monitor subtype and lineage for influenza viruses.
**County Influenza Activity**

As of 10:00 a.m. November 21, 2012 a total of 67 (100%) counties had reported their weekly level of influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Most counties report no or mild activity. Seven counties report moderate activity.

Map 2: Weekly County Influenza Activity for Week 46 as Reported by 10:00 a.m. November 21, 2012
County influenza activity data is reported to the BOE through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 16-25 displayed below reflect a county’s assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 46, no counties indicated that activity was decreasing, 31 indicated it was about the same as previous weeks, and 30 indicated that activity was increasing.

FIGURE 16 shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 46 as of 10:00 a.m. November 21, 2012.

Definitions for the County Influenza Activity Trends are available at: http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.

Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.

High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.

Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm

FIGURE 17 - FIGURE 18 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 46 as of 10:00 a.m. November 21, 2012.
FIGURE 19 - FIGURE 25 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 46 as of 10:00 a.m. November 21, 2012.
Because of less than 100% reporting in the Florida Pneumonia and Influenza Mortality Surveillance System in week 45, pneumonia and influenza (P&I) mortality data from ESSENCE-FL are used in this report. Over the past year, the FDOH Bureau of Vital Statistics and County Health Departments have been rolling out an electronic death record system for Florida. ESSENCE-FL now displays electronic death record data from all 67 Florida counties. For P&I surveillance, death record literals are queried in ESSENCE-FL using a free-text query that searches for references to pneumonia and influenza on death certificates. Any mention of pneumonia or influenza in the death certificate literals, with certain exceptions, is counted as a P&I death. Numbers may change as more data are received. The most recent data available are displayed here.

ESSENCE-FL death records data are currently considered to be reliable through week 45, 2012.

For week 45 (ending November 10th, 2012) there were:
- 134 deaths reported
- Upper bound of 95% confidence interval for prediction: 182 deaths
- NO excess deaths

The majority of the deaths are in those aged 75 years and older.
The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses. Twenty-one facilities reported in week 46.

**FIGURE 29** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida. The 6 respiratory viruses summarized in Figure 29 are:
- Respiratory Syncytial Virus (RSV)
- Parainfluenza 1-3
- Adenovirus
- Human Metapneumovirus (HMPV)
- Rhinovirus
- Influenza

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses. Twenty-one facilities reported in week 46.

**FIGURE 29:** Percentage of Positive Respiratory Virus Tests as Collected by NREVSS, Florida, 2010-2012, as of November 20, 2012

Influenza and ILI Outbreaks

In week 46 there were no ILI outbreaks reported into EpiCom.

Map 3: Weekly County Influenza Outbreak Activity for Week 46 as Reported by 11:00 a.m. November 21, 2012

Four influenza or ILI outbreaks have been reported into EpiCom in the 2012-2013 season.

Pediatric Influenza-Associated Mortality

In week 46 there were no influenza-associated pediatric deaths reported statewide.

No influenza-associated pediatric deaths have been reported in Florida so far in the 2012-13 season.
