The Florida Department of Health (FDOH) uses many different surveillance systems to measure influenza activity. A summary of all these systems can be found at the top of page 2.

National:
- According to CDC, influenza activity is increasing nationwide. The most influenza activity is in the southern region of the country. Nationwide, influenza A H3N2 is the most commonly detected influenza subtype.

State:
- Influenza-like illness activity is increasing statewide
- Currently, influenza and influenza-like illness (ILI) activity is increasing in all regions of Florida, which is normal for this time of year. Although influenza activity is increasing statewide, recent flu activity has been focused in North and Central Florida.
- The Panhandle and Central Florida regions are showing higher than expected ILI activity in emergency department visits for ILI, as monitored through ESSENCE-FL.
- Seven counties report moderate influenza activity in week 48. Six of those counties are located in the North and Central Florida regions.
- Because of these regional increases in influenza and ILI activity, Florida is reporting Regional influenza activity to CDC for week 48.
  - The activity level refers to the geographic spread of influenza, not its severity or intensity.
- In Florida, flu is typically most active beginning in late December or early January, so flu activity in these regions is rising a few weeks earlier than most previous years at this time.

Influenza B is the most common flu type in Florida this season
- The Bureau of Public Health Laboratories (BPHL) tests select influenza surveillance specimens, such as those from outbreak investigations and sentinel healthcare providers.
- Of the tests that have been influenza positive, most have been positive for influenza B; the rest have been influenza A H3. These are both seasonal subtypes of influenza.
  - While influenza B is the most common flu type detected in Florida, the rest of the country is seeing mostly influenza A H3.
- In week 48 BPHL tested 57 specimens, and 25 tested positive: 15 for influenza B, one for influenza A H3, and nine for influenza A (not yet subtyped).

There was one influenza outbreak reported in week 48
- Alachua County: facility for disabled persons reported residents and staff with ILI symptoms. BPHL results to determine the type of influenza are pending.

There was one pediatric influenza-associated mortality reported in week 48
- Wakulla county: unvaccinated patient with confirmed influenza B infection.
- This is Florida’s first reported pediatric influenza death in the 2012-13 season.
ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 110 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submitting ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing. For this season, the Bureau of Epidemiology (BOE) has designated 16 of these ILINet physicians’ offices as Super-Sentinels. These Super-Sentinels will receive more active follow-up from BOE and participating county health departments, with the goal of increasing data quality and surveillance specimen submission. Complete laboratory and visit data from Florida ILINet Super-Sentinels will be presented in the Florida Flu Review in future weeks.

**ILINET Influenza-like Illness-Statewide**

ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 110 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submitting ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing. For this season, the Bureau of Epidemiology (BOE) has designated 16 of these ILINet physicians’ offices as Super-Sentinels. These Super-Sentinels will receive more active follow-up from BOE and participating county health departments, with the goal of increasing data quality and surveillance specimen submission. Complete laboratory and visit data from Florida ILINet Super-Sentinels will be presented in the Florida Flu Review in future weeks.

**FIGURE 1** shows the percentage of visits for ILI* reported by ILINet Sentinel Providers statewide.

ILI percent positive remains low and similar to other non-pandemic seasons at this time.

64 of 110 ILINet Sentinels reported visit counts as of 11:30 a.m., December 5, 2012.

13 of 15 ILINet Super-Sentinels reported visit counts as of 11:30 a.m., December 5, 2012.

**FIGURE 2** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

ILI visit counts are decreasing in the 0-4 age groups in week 48. ILI visit counts are increasing in the 64+ and 5-24 age groups in week 48. ILI visit counts are flat in the 25-64 age group.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

*There is no week 53 during the 2009-2010, 2010-2011, and 2011-12 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not
Florida uses ESSENCE-FL for syndromic surveillance, which currently collects data daily from 174 hospital emergency departments (ED). These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words "influenza" or "flu," or complaints that contain fever plus cough or sore throat.

**FIGURE 3** shows ESSENCE-FL data on ILI visits to EDs as a percentage of all ED Visits.

Overall activity for influenza-like illness reported in ESSENCE-FL is similar to levels seen during the 2010-2011 season at this time, but higher than 2011-2012 season.

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.*

**FIGURE 4** shows percentage of ILI among all ED visits by age group.

Age-specific trends show that percent ILI in the 0 to 55+ age group is increasing for week 48.

One hundred five ESSENCE-FL participating facilities are able to provide discharge disposition data for their ED visits going back to week 40, 2010. Using this information, the percent of ED visits for ILI that result in hospitalization can be calculated. The highest percentage of admissions is in the 55+ years old age group. The low number of visits in the 55+ age group causes variability in the ILI admission percentage from week to week.

**FIGURE 5** shows the percentage of ED visits for ILI that resulted in hospitalization, by age group.
ILI activity in ESSENCE-FL is elevated in Regions 1, 2 and 5. ILI levels in all other regions are at or below levels seen in previous non-pandemic seasons at this time.

*There is no week 53 for the 2009-2010, 2010-2011 and 2011-2012 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.

Map 1: Hospitals Reporting Emergency Department (ED) Data to ESSENCE-FL, December 4, 2012 (N=174)
FIGURE 14 - FIGURE 15 use BPHL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BPHL, what proportion of those test positive for influenza, and what subtypes are found for the positive influenza specimens.

Small numbers of influenza specimens submitted to BPHL tested positive for influenza A H3, 2009 H1N1, and influenza B. Influenza B has been the most common strain detected by BPHL in recent weeks.

In addition to PCR testing, BPHL also uses culture testing for influenza specimens, including those positive for influenza B.

There are two distinct antigenic lineages of influenza B, known as Victoria and Yamagata. Both have circulated in Florida in the past year.

This season, 12 specimens have tested positive for influenza B, Victoria lineage and one specimen has tested positive for influenza B, Yamagata lineage. Last year's 2011-12 vaccine included a Victoria lineage virus, while this year's 2012-2013 vaccine includes a Yamagata lineage virus. Influenza viruses that circulate at the beginning of the flu season may be different than those that circulate later in the year, and these specimens represent a very small sample of statewide influenza activity. Not all flu positive specimens receive culture testing. FDOH will continue to monitor subtype and lineage for influenza viruses.

TABLE 2 shows the number of specimens tested by BPHL, how many are influenza positive, and their subtypes.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date collected, date received by the laboratory, date reported, or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

As of 10:00 a.m. December 5, 2012 a total of 67 (100%) counties had reported their weekly level of influenza activity. *Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.*

Most counties report no or mild activity. Eight counties report moderate activity.
County influenza activity data is reported to the BOE through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 16-25 displayed below reflect a county’s assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 48, one county indicated that activity was decreasing, 32 indicated it was about the same as previous weeks, and 28 indicated that activity was increasing.

**FIGURE 16** shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 48 as of 10:00 a.m. December 5, 2012.

Definitions for the County Influenza Activity Trends are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html](http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html)

Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

- **No or very minimal activity** -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
- **Moderate activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
- **High activity** -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
- **Very high activity** -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm](http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm)

**FIGURE 17 - FIGURE 18** show the activity levels in various facilities by county as reported by county health department flu coordinators for week 48 as of 10:00 a.m. December 5, 2012.
FIGURE 19 - FIGURE 25 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 48 as of 10:00 a.m. December 5, 2012.
Because of less than 100% reporting in the Florida Pneumonia and Influenza Mortality Surveillance System in week 47, pneumonia and influenza (P&I) mortality data from ESSENCE-FL are used in this report. Over the past year, the FDOH Bureau of Vital Statistics and County Health Departments have been rolling out an electronic death record system for Florida. ESSENCE-FL now displays electronic death record data from all 67 Florida counties. For P&I surveillance, death record literals are queried in ESSENCE-FL using a free-text query that searches for references to pneumonia and influenza on death certificates. Any mention of pneumonia or influenza in the death certificate literals, with certain exceptions, is counted as a P&I death. Numbers may change as more data are received. The most recent data available are displayed here. *ESSENCE-FL death records data are currently considered to be reliable through week 47, 2012.*

**FIGURE 26** shows the reported count of pneumonia and influenza deaths for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 47 (ending November 24, 2012) there were:
- 143 deaths reported
- Upper bound of 95% confidence interval for prediction: 187 deaths
- NO excess deaths

The majority of the deaths are in those aged 75 years and older.

**FIGURE 27** shows pneumonia and influenza deaths for all Florida counties, Week 40, 2010 - Week 49, 2012, as reported into ESSENCE-FL.

**FIGURE 28** shows pneumonia and influenza deaths for all Florida counties by age group, Week 40, 2010 - Week 49, 2012, as reported into ESSENCE-FL.
The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses. Eighteen facilities reported in week 48.

**FIGURE 29** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The 6 respiratory viruses summarized in Figure 29 are:

- Respiratory Syncytial Virus (RSV)
- Parainfluenza 1-3
- Adenovirus
- Human Metapneumovirus (HMPV)
- Rhinovirus
- Influenza

Influenza and ILI Outbreaks

In week 48 there was one ILI outbreak reported into EpiCom.

- Alachua County: A long-term care facility for persons with disability reported that ten out of twenty-one residents and one staff member had ILI symptoms. One specimen tested rapid-antigen positive for influenza. Another specimen was collected and forwarded to BPHL. Results are pending. Nine of the ten residents were vaccinated. All ill residents are being treated with antivirals.

**Pediatric Influenza-Associated Mortality**

In week 48 there was an influenza-associated pediatric death in a resident of Wakulla County. The resident was unvaccinated, and BPHL has PCR-confirmed influenza B.

One Influenza-associated pediatric death has been reported in Florida so far in the 2012-13 season.
