The Florida Department of Health (FDOH) uses many different surveillance systems to measure influenza activity. A summary of all these systems can be found on page 11.

**On April 1, 2013, the World Health Organization reported that confirmed human infection with novel avian influenza A (H7N9) was identified in China.** The first onset of illness was on February 19, 2013. Eighty-two total confirmed cases have been reported as of April 17, all in China. Seventeen infected individuals have died.

- There is no evidence that novel influenza A H7N9 is capable of sustained person-to-person transmission.
- There is no evidence of novel influenza A H7N9 infection in the United States or any countries other than China. No travel advisories to China are in effect.
- On April 5, FDOH distributed a CDC Novel Influenza A (H7N9) Health Advisory to state, county and community health partners via EpiCom, Florida’s health alert notification system.
- More information on influenza A H7N9 and other novel and variant influenza viruses can be found at: [http://www.doh.state.fl.us/Environment/medicine/arboviral/zoonoses/Zoonotic-avian.html](http://www.doh.state.fl.us/Environment/medicine/arboviral/zoonoses/Zoonotic-avian.html)
- Influenza A H7N9 is a kind of influenza normally found in birds. These are the first identified cases of human infection with influenza A H7N9.

**Sixty-six Florida counties reported Mild or No influenza activity.** One county reported Moderate influenza activity. Twenty-nine counties reported declining influenza activity.

- **Emergency department and urgent care center influenza-like illness (ILI) visits have decreased overall in recent weeks.** In emergency departments and urgent care centers reporting to ESSENCE-FL, the statewide percent of emergency department visits for ILI was less than 3%.
  - In the Panhandle, Central, and South Florida, ILI visits decreased in the current week.
  - In Northeast, emergency department visits for ILI increased in the current week.

- **Nationally (including Florida), the most common subtypes of influenza detected this season have been influenza A H3, followed by influenza B.** In the last few weeks, Influenza B is the most commonly detected subtype in Florida and nationwide.
  - In week 15, nine of the 23 specimens submitted for influenza testing at BPHL tested positive for influenza. Influenza B, influenza A H3 and 2009 influenza A H1N1 have been detected. All of these are seasonal strains of influenza.
  - Specimen submission continues to decline.
  - Nationally (including Florida), almost all circulating influenza is a good match for the vaccine.

- **No influenza or ILI outbreaks (epidemiologically linked cases of influenza in a single setting) were reported in week 15.**

- **No pediatric influenza-associated deaths were reported in week 15, 2013.**
  - Eight pediatric influenza-associated deaths have been reported in the 2012-2013 season.

- The preliminary estimated number of Florida deaths due to pneumonia or influenza in week 14 is lower than the seasonal baseline, based on previous years’ data. Estimated deaths due to pneumonia and influenza are identified using preliminary death certificate data.
  - Nationwide data from CDC show pneumonia and influenza deaths for week 14 within expected levels.

- **Because of low activity in most regions of the state, Florida reported Sporadic influenza activity to CDC in week 15.**
  - This activity level represents the geographic spread of influenza in Florida.

**Weekly state influenza activity:**

- **Sporadic**
  - No Activity
  - Sporadic
  - Local
  - Regional
  - Widespread

**In this Issue:**

- Summary
- Outpatient Influenza-Like Illness Surveillance Network (ILI.NET)-Statewide

---

**County Influenza Activity Week 15, 2013**

- No Report
- No Activity
- Mild
- Moderate
- Widespread

Forty counties reported mild influenza activity. For more information, see page 6.

**Influenza Outbreaks Week 40, 2012 – Week 15, 2013**

- 0 Outbreaks
- 1-2 Outbreaks
- 3-4 Outbreaks
- 5+ Outbreaks

**Fifty-one outbreaks of influenza or ILI have been reported since October, 2012 (none in week 15, 2013).** For more information, see page 10.
Summary

Descriptions of Florida influenza and ILI surveillance systems can be found on page 11.

**ILINet Influenza-Like Illness-Statewide**

ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 110 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submitting ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing. For this season, the Bureau of Epidemiology (DCBE) has designated 13 of these ILINet physicians’ offices as Super-Sentinels. These Super-Sentinels receive more active follow-up from DCBE and participating county health departments, with the goal of increasing data quality and surveillance specimen submission.

**FIGURE 1** shows the percentage of visits for ILI* reported by ILINet sentinel providers statewide.

The percent of visits to sentinel outpatient physicians for ILI has increased slightly in the last three weeks after declining for several weeks.

58 of 110 ILINet Sentinel providers reported visit counts as of 12:00 p.m., April 17, 2013.

7 of 13 ILINet Super-Sentinels reported visit counts as of 12:00 p.m., April 17, 2013.

**FIGURE 2** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

In week 15, the number of visits to sentinel outpatient physicians decreased in all age groups.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.
*There is no week 53 during the 2009-2010, 2010-2011, and 2011-12 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

†Data presented here are counts, not proportions as included in Figure 2. This is because age group denominator data is not available through ILINet.
ESSENCE-FL collects data daily from 180 hospital emergency departments (ED) and urgent care centers (UCC). These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain fever plus cough or sore throat.

**FIGURE 3** shows ESSENCE-FL data on ILI visits to EDs and UCCs as a percentage of all visits.

The percent of visits to emergency departments for ILI decreased for the past few weeks.

**FIGURE 4** shows percentage of ILI among all ED and UCC visits by age

In the current week, the percent of visits to emergency departments and urgent care centers for ILI is similar to previous years at this time for all age groups.

One hundred five ESSENCE-FL participating facilities are able to provide discharge disposition data for their ED visits going back to week 40, 2010. Using this information, the percent of ED visits for ILI that result in hospitalization can be calculated. The highest percentage of admissions is in the 55+ years old age group. The low number of visits in the 55+ age group causes variability in the ILI admission percentage from week to week.

**FIGURE 5** shows the percentage of ED and UCC visits for ILI that resulted in hospitalization, by age group.

Of persons 55 years and older that visited an emergency department with ILI complaints, between 20% and 25% were admitted.

*There is no week 53 for the 2007-2008, 2009-2010, and 2010-2011 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.*
The percent of emergency department and urgent care center visits for ILI is near expected levels in all regions of Florida. Percent ILI increased slightly in Regions 3 and 5 this week.

Map 1: Emergency Departments and Urgent Care Centers reporting data to ESSENCE-FL, April 17, 2013 (N=180)

FIGURE 6 - FIGURE 12 describe ED and UCC chief complaint data from ESSENCE-FL by Regional Domestic Security Task Force (RDSTF).

*There is no week 53 for the 2009-2010, 2010-2011 and 2011-2012 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Historical data for region 2 is only available beginning week 1, 2009.
Recent influenza specimens submitted to BPHL tested positive for influenza A H3, 2009 H1N1, and influenza B.

In recent weeks, influenza B has been the most common strain detected by BPHL. The numbers of submitted specimens have decreased with declining rates of ILI seen throughout the state.

In addition to PCR testing, BPHL also cultures influenza specimens, including those positive for influenza B.

There are two distinct antigenic lineages of influenza B, known as Victoria and Yamagata. Both have circulated in Florida in the past year.

At BPHL this season, 27 specimens have tested positive for Victoria lineage influenza B and 9 specimens have tested positive for Yamagata lineage influenza B. Last year’s 2011-12 vaccine included a Victoria lineage virus, while this year’s 2012-2013 vaccine includes a Yamagata lineage virus. Influenza viruses that circulate at the beginning of the flu season may be different than those that circulate later in the year, and these specimens represent a very small sample of statewide influenza activity. Not all flu positive specimens are cultured. FDOH will continue to monitor subtype and lineage for influenza viruses.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date collected, date received by the laboratory, date reported, or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

As of 9:30 a.m. April 17, 2013 a total of 67 (100%) counties had reported their weekly level of influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

County influenza activity data is reported to the DCBE through EpiGateway on a weekly basis by the county influenza coordinator. Specific information is requested about laboratory results, outbreak reports, and surveillance system activity. Figures 16-25 displayed below reflect a county’s assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 14, 28 counties indicated that activity was decreasing, 35 indicated it was about the same as previous weeks, and one indicated that activity was increasing.

**FIGURE 15** shows the assessment of the overall influenza activity trend in each county as reported by county health department flu coordinators for week 15 as of 9:30 a.m. April 17, 2013.

Definitions for the County Influenza Activity Trends are available at: [http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html](http://www.doh.state.fl.us/disease_ctrl/epi/CountyInfluenzaTrendGuide.html)
Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle, and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

County influenza settings assessment guides are available at: http://www.doh.state.fl.us/disease_ctrl/epi/FluAssessment.htm

FIGURE 16 - FIGURE 19 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 15 as of 9:30 a.m., April 17, 2013.
FIGURE 20 - FIGURE 24 show the activity levels in various facilities by county as reported by county health department flu coordinators for week 15 as of 9:30 a.m., April 17, 2013.

Pediatric Influenza-Associated Mortality

In week 15 2013, there were no influenza-associated pediatric deaths reported in Florida.

Eight influenza-associated pediatric deaths have been reported in Florida since October, 2012.
Over the past year, the FDOH Bureau of Vital Statistics and county health departments have been rolling out an electronic death record system for Florida. ESSENCE-FL now displays electronic vital statistics death record data from all 67 Florida counties. For pneumonia and influenza surveillance, death record literals are queried in ESSENCE-FL using a free-text query that searches for references to pneumonia and influenza on death certificates. Any mention of pneumonia or influenza in the death certificate literals, with certain exceptions, is counted as a pneumonia and influenza death. Current season pneumonia and influenza death numbers are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. ESSENCE-FL vital statistics death records data are currently considered to be complete through week 14, 2013.

**FIGURE 25** shows the count of preliminary estimated pneumonia and influenza deaths for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 14 (ending April 6, 2013) there were:
- 209 preliminary estimated pneumonia and influenza deaths reported
- Upper bound of 95% confidence interval for prediction: 229 deaths
- **No excess deaths.**

In several recent weeks, preliminary pneumonia and influenza associated deaths have exceeded the upper bound of the 95% confidence interval for prediction.

**FIGURE 26** shows pneumonia and influenza deaths for all Florida counties, Week 40, 2010 - Week 16, 2013, as reported into ESSENCE-FL.

**FIGURE 27** shows pneumonia and influenza deaths for all Florida counties by age group, Week 40, 2010 - Week 16, 2013, as reported into ESSENCE-FL.

*Death records data reported into ESSENCE-FL are currently considered to be complete through week 16, 2013.*
FIGURE 29 shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida. The 6 respiratory viruses summarized in Figure 29 are:

- Respiratory Syncytial Virus (RSV)
- Parainfluenza 1-3
- Adenovirus
- Human Metapneumovirus (HMPV)
- Rhinovirus
- Influenza

The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses. Fifteen Florida facilities reported in week 15.

Influenza and ILI Outbreaks

In week 15, 2013 there were no influenza and ILI outbreaks reported in EpiCom. Fifty-one outbreaks of influenza or ILI have been reported so far in the 2012-2013 flu season.

Map 3: Influenza and ILI outbreaks by county, Week 40, 2012 - Week 15, 2013 as Reported by 10:00 a.m. April 17, 2013

Fifty-one influenza or ILI outbreaks have been reported into EpiCom in the 2012-2013 season.

                                      |                      | • Five outbreaks were due to influenza A (subtype not identified) and influenza B  

Total  51

Florida Surveillance System Summary

- **Florida ILINet**  
  Measures trends in ILI visits to outpatient doctor’s offices  
  Doctors submit specimens from ill patients for influenza testing  
  Network of volunteer healthcare providers who:  
  - Report ILI and total visit counts every week  
  - Submit specimens for confirmatory testing  

- **ESSENCE-FL Syndromic Surveillance**  
  Measures trends in ILI visits and hospital admissions from emergency departments and urgent care clinics  
  Emergency departments and urgent care clinics electronically transmit visit data into ESSENCE-FL daily  
  Visit data summarized in the Florida Flu Review include:  
  - Percent of ED/urgent care visits due to ILI  
  - Percent of ED/urgent care visitors with ILI who are admitted to the hospital  

- **ESSENCE-FL Vital Statistics Portal**  
  Death certificates with pneumonia or influenza listed as a cause of death are used as a proxy to measure influenza mortality  
  Death certificate data from the Bureau of Vital Statistics can be accessed through ESSENCE-FL  
  Vital statistics data in ESSENCE are used for pneumonia and influenza mortality surveillance  

- **County Influenza Activity in EpiGateway**  
  Uses data provided by CHDs to create a county-by-county breakdown of influenza and ILI activity around the state  
  CHD epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website  
  Influenza activity is classified as: No Activity, Mild, Moderate, or Widespread  
  Setting-specific influenza activity and influenza trend is also reported  

- **Outbreak Reporting in EpiCom**  
  Tracks influenza and ILI outbreak investigations by CHDs  
  Shows what types of influenza are responsible for outbreaks and where outbreaks are occurring  
  CHD epidemiologists report outbreaks of influenza or ILI into EpiCom, Florida’s online disease communication system  
  Outbreaks are defined as two or more cases of influenza or ILI in a specific setting  

- **BPHL Viral Surveillance**  
  BPHL performs confirmatory testing and subtyping on surveillance specimens  
  Surveillance specimens come from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners  

- **Case-Based Influenza Surveillance**  
  Pediatric Influenza-Associated Mortality  
  Deaths in children with laboratory-confirmed influenza infection are reportable in Florida  
  Influenza due to Novel or Pandemic Strains  
  Patients with influenza infection due to novel or pandemic strains are reportable in Florida  

- **NREVSS**  
  Measures trends in different viruses that cause respiratory disease  
  Network of laboratories who report counts of test results for common respiratory viruses, including influenza, RSV, rhinovirus, and others  

Information on locating influenza vaccination can be found using the flu vaccine locator at: [http://flushot.healthmap.org/](http://flushot.healthmap.org/)
