**Summary**

The Florida Department of Health (FDOH) uses many different surveillance systems to measure influenza activity. A summary of all these systems can be found on page 11.

**National:**
- Influenza activity continues to decline nationally. In certain parts of the country, activity remains elevated.
- The predominant circulating strain this year continues to be influenza A (2009 H1N1).
- The Centers for Disease Control and Prevention continue to recommend vaccination as long as influenza viruses are circulating.

**State:**
- This season, FDOH has received reports of severe influenza illness, including hospitalizations, requiring intensive care unit (ICU) care among pregnant women.
  - None of these women received the 2013-2014 influenza vaccine.
- Most Florida counties are reporting mild influenza activity. In week 15, 34 counties reported decreasing influenza activity; 29 counties indicated activity is at a plateau.
- Emergency department (ED) and urgent care center (UCC) influenza-like illness (ILI) visits have decreased in recent weeks and is as expected for this time of year; preliminary data suggest that the influenza season has peaked.
  - While activity statewide is generally decreasing, those at high risk for infection, such as pregnant women, are among those presenting to EDs and UCCs for care.
- In Florida, the most common influenza subtype detected at the Bureau of Public Health Laboratories (BPRL) in recent weeks has been influenza A (2009 H1N1).
  - In week 15, 2 of 15 specimens submitted for influenza testing at BPRL were PCR positive for influenza. Both were PCR positive for influenza B. This is a seasonal strain of influenza.
  - Nationally (including Florida), almost all circulating influenza is a good match for the vaccine.
- One influenza or ILI outbreak (epidemiologically-linked cases of influenza in a single setting) was reported to EpiCom in a Jackson county household in week 15.
- No pediatric influenza-associated deaths were reported in week 15. Four pediatric influenza-associated deaths have been reported in the 2013-2014 season.
- The preliminary estimated number of Florida deaths due to pneumonia or influenza in week 14 is lower than the seasonal baseline, based on previous years’ data. Estimated deaths due to pneumonia and influenza are identified using preliminary death certificate data.
- Because of sporadic influenza activity in some areas of the state, Florida reported sporadic influenza activity to CDC in week 15. This activity level represents the geographic spread of influenza in Florida.

**Weekly State Influenza Activity:**

- No Activity
- Sporadic
- Local
- Regional
- Widespread

**Influenza and ILI Outbreaks Reported:**

- No outbreaks
- 1-2 outbreaks
- 3-4 outbreaks
- 5+ outbreaks

![FIGURE 1: Percentage of Visits for Influenza-Like Illness (ILI) Reported by ILINet Sentinel Providers Statewide, 2010-2011 (Weeks 40-39), 2011-2012 (Weeks 40-39), 2012-2013 (Week 40-39) and 2013-2014 (Weeks 40-15) Reported by 5:00 p.m. April 15, 2014](image)

**FIGURE 1** shows the percentage of visits for ILI* reported by ILINet sentinel providers statewide.

The percent of visits to ILINet sentinel outpatient physicians for ILI is below levels seen at this time in previous years:

- Fifty-two of 107 ILINet providers reported visit counts as of 5:00 p.m., April 15, 2014.
- Seven of 13 ILINet Super-Sentinels reported visit counts as of 5:00 p.m., April 15, 2014.

![FIGURE 2: Influenza-Like Illness Visit Counts Reported by ILINet Sentinel Providers Statewide by Age Group Week 52, 2010-Week 15, 2014 as Reported to ILINet by 5:00 p.m. April 15, 2014](image)

**FIGURE 2** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

In week 15, the number of visits to ILINet sentinels for ILI decreased in all age groups.

- Data presented here are counts, not proportions as included in Figure 1. This is because age group denominator data is not available through ILINet.

---

**ILINet Influenza-Like Illness-Statewide**

ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 107 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the BPHL for confirmatory testing. For this season, the Bureau of Epidemiology (DCBE) has designated 13 of these ILINet physicians' offices as Super-Sentinels. These Super-Sentinels receive more active follow-up from DCBE and participating county health departments (CHDs), with the goal of increasing data quality and surveillance specimen submission.
ESSENCE-FL Syndromic Surveillance-Statewide

ESSENCE-FL collects data daily from 198 EDs and UCCs. These data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words "influenza" or "flu," or complaints that contain fever plus cough or sore throat.

**FIGURE 3** shows ESSENCE-FL data on ILI visits to EDs and UCCs as a percentage of all visits.

The percent of visits to EDs and UCCs for ILI are at or below levels seen in previous years at this time.

**FIGURE 4** shows percentage of ILI among all ED and UCC visits by age.

The percent of ED and UCC visits for ILI is similar to previous years at this time.

ESSENCE-FL Syndromic Surveillance-Regional

Map 3: Emergency Departments and Urgent Care Centers Reporting Data to ESSENCE-FL by Regional Domestic Security Task Force (RDSTF), April 16, 2014 (N=198)
The percent of ED and UCC visits for ILI is near expected levels.
- RDSTF Regions 1-3 reported increasing visits for ILI to EDs and UCCs in week 15, 2014.
- RDSTF Regions 4-7 reported decreasing visits for ILI to EDs and UCCs in week 15, 2014.
- New facilities were recently added to RDSTF Region 6. Historical data for figure 10 will be revised to reflect these new facilities as it becomes available.

*There is no week 53 for the 2010-2011, 2011-2012, and 2013-2014 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
Influenza A (2009 H1N1), influenza A (H3) and influenza B have been identified by BPHL this season.

In recent weeks, influenza specimens submitted to BPHL tested positive for influenza A 2009 H1N1, influenza A (H3) and influenza B.

Influenza A (2009 H1N1) has been the most common strain of influenza detected by BPHL so far in the 2013-2014 influenza season.

TABLE 2 shows the number of specimens tested by BPHL, how many are influenza positive and their subtypes.

FIGURE 12 - FIGURE 13 use BPHL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BPHL, what proportion of those test positive for influenza and what subtypes are identified.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.

County Influenza and ILI Activity

As of 11:30 a.m. April 16, 2014, a total of 67 (100%) counties reported their weekly level of influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

No counties reported moderate activity.

Thirty-four counties reported decreasing influenza and ILI activity.

County influenza activity data are reported to DCBE through EpiGateway on a weekly basis by each county influenza coordinator. Specific information is requested about laboratory results, outbreak reports and surveillance system activity. Figures 14-23, displayed below reflect a county's assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 15, 34 counties indicated that activity was decreasing, 29 indicated activity was about the same as previous weeks and 2 indicated that activity was increasing.

FIGURE 14 shows the assessment of the overall influenza activity trend in each county as reported by CHD influenza coordinators for week 15 as of 11:30 a.m. April 16, 2014.
Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

**FIGURE 15 - FIGURE 18** show the activity levels in various facilities by county as reported by CHD influenza coordinators for week 15 as of 11:30 a.m., April 16, 2014.
FIGURE 19 - FIGURE 23 show the activity levels in various facilities by county as reported by CHD influenza coordinators for week 15 as of 11:30 a.m., April 16, 2014.

In week 15, 2014, no influenza-associated pediatric deaths were reported in Florida.

Four influenza-associated pediatric deaths have been reported so far in the 2013-2014 influenza season.

Pediatric Influenza-Associated Mortality
ESSENCE-FL Pneumonia and Influenza Mortality

Over the past year, the FDOH Bureau of Vital Statistics and CHDs have been rolling out an electronic death record system for Florida. ESSENCE-FL now displays electronic vital statistics death record data from all 67 Florida counties. For pneumonia and influenza surveillance, death record literals are queried in ESSENCE-FL using a free-text query that searches for references to pneumonia and influenza on death certificates. Any mention of pneumonia or influenza in the death certificate literals, with certain exceptions, is counted as a pneumonia and influenza death. Current season pneumonia and influenza death numbers are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. ESSENCE-FL vital statistics death records data are currently considered to be complete through week 14, 2014.

**FIGURE 24** shows the count of preliminary estimated pneumonia and influenza deaths for all Florida counties, the number of deaths predicted using a multi-year regression model and the upper bound of the 95% confidence interval for this prediction.

For week 14 (ending April 5, 2014):
- 180 preliminary estimated pneumonia and influenza deaths were reported.
- Upper bound of 95% confidence interval for prediction: 229 deaths.
- No excess deaths.

**FIGURE 25** shows pneumonia and influenza deaths for all Florida counties, week 40, 2010 - week 16, 2014, as reported into ESSENCE-FL. Deaths due to pneumonia and influenza are at levels seen during previous years at this time.

**FIGURE 26** shows pneumonia and influenza deaths for all Florida counties by age group, week 40, 2010 - week 16, 2014, as reported into ESSENCE-FL.

Death records data reported into ESSENCE-FL are currently considered to be complete through week 14, 2014.
The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses. Seven Florida facilities reported in week 15.

**FIGURE 27** shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The 6 respiratory viruses summarized in Figure 27 are:
- Respiratory Syncytial Virus (RSV)
- Parainfluenza 1-3
- Adenovirus
- Human Metapneumovirus (HMPV)
- Rhinovirus
- Influenza

**Influenza and ILI Outbreaks Reported in EpiCom**

In week 15 2014, one influenza or ILI outbreaks was reported in EpiCom.

Jackson County: A household cluster of coronavirus OC43 and influenza A (2009H1N1). Three family members and a friend traveled to Tennessee over spring break. Their hosts in Tennessee reported ILI, later confirmed to be due to influenza A (2009 H1N1). Upon return, specimens were collected from the symptomatic family members who tested negative for influenza by PCR but positive for coronavirus OC43 at BPHL. The family friend tested positive for influenza A (2009 H1N1).

Twenty-two influenza or ILI outbreaks have been reported into EpiCom so far in the 2013-2014 season.
