Week 42: October 12 - 18, 2014

Summary

The Florida Department of Health (DOH) uses many different surveillance systems to measure influenza activity. A summary of all these systems can be found on page 11.

Enterovirus D68 (EV-D68) activity:
- EV-D68 is one of more than 100 non-polio enteroviruses. This virus was first identified in California in 1962. The U.S. is currently experiencing a nationwide outbreak of EV-D68 associated with severe respiratory illness.
- EV-D68 has been identified in Florida residents. For more information, please visit: http://www.floridahealth.gov/diseases-and-conditions/d68/.

National influenza activity:
- Influenza activity continues to increase nationally.
- The Centers for Disease Control and Prevention continue to recommend vaccination as long as influenza viruses are circulating.

State Influenza and influenza-like illness (ILI) activity:
- Most Florida counties are reporting mild influenza activity. In week 42, 25 counties reported increasing influenza activity; 37 counties indicated activity is at a plateau.
- Emergency department (ED) and urgent care center (UCC) influenza-like illness (ILI) visits have remained low but are increasing in all regions, which is typical for this time of year.

- In Florida, the most common influenza subtype detected at the Bureau of Public Health Laboratories (BPHL) in recent weeks has been influenza A (H3): In week 42, 24 of 58 (41.4%) specimens submitted for influenza testing at BPHL were PCR positive for influenza. Fourteen were positive for influenza A (H3), six were positive for A unspecified, two were positive for influenza B unspecified, one was positive for influenza B Yamagata lineage and one was positive for influenza B Victoria lineage. These are seasonal strains of influenza.

- Seven influenza or ILI outbreaks (epidemiologically-linked cases of influenza in a single setting) were reported to EpiCom in week 42.

- No pediatric influenza-associated deaths were reported in week 42.

- The preliminary estimated number of Florida deaths due to pneumonia or influenza in week 41 was below excess thresholds.

- Because of increasing influenza activity in some areas of the state, Florida reported local influenza activity to CDC in week 42. This activity level represents the geographic spread of influenza in Florida.

Map 1: County Influenza Activity
Week 42, 2014

Forty-three counties reported mild influenza activity. For more information, see page 6.

Map 2: Influenza and ILI Outbreaks
Week 42, 2014

Eight outbreaks of ILI or influenza have been reported since Week 40, 2014. For more information, see page 10.

Weekly state influenza activity:

Predominantly circulating influenza strain this season:

A (H3)
ILINet is a nationwide surveillance system composed of sentinel providers. Florida has 107 providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the BPHL for confirmatory testing. For this season, the Bureau of Epidemiology (BOE) has designated 13 of these ILINet physicians’ offices as Super-Sentinels. These Super-Sentinels receive more active follow-up from BOE and participating county health departments (CHDs), with the goal of increasing data quality and surveillance specimen submission.

**FIGURE 1** shows the percentage of visits for ILI* reported by ILINet sentinel providers statewide.

The percent of visits to ILINet sentinel outpatient physicians for ILI is above levels seen at this time in previous years:

- Fifty-four of 107 ILINet providers reported visit counts as of 5:00 p.m., October 21, 2014.
- Eight of 13 ILINet Super-Sentinels reported visit counts as of 5:00 p.m., October 21, 2014.

**FIGURE 2** shows ILI visit counts reported by ILINet sentinel providers statewide by age group.

In week 42, the number of visits to ILINet sentinels for ILI decreased in the 0-4 and 25-64 age groups, and increased in the 5-24 and 65+ age groups.

*ILI = Influenza-like illness, fever >100°F AND sore throat and/or cough in the absence of another known cause.

†Data presented here are counts, not proportions as included in Figure 1. This is because age group denominator data is not available through ILINet.
ESSENCE-FL Syndromic Surveillance-Statewide

ESSENCE-FL collects data daily from 216 EDs and UCCs. These data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain fever plus cough or sore throat.

**FIGURE 3** shows ESSENCE-FL data on ILI visits to EDs and UCCs as a percentage of all visits.

The percent of visits to EDs and UCCs for ILI is above levels seen in previous years at this time.

**FIGURE 4** shows percentage of ILI among all ED and UCC visits by age.

The percent of ED and UCC visits for ILI is above levels seen in previous years at this time.

ESSENCE-FL Syndromic Surveillance-Regional

Map 3: Emergency Departments and Urgent Care Centers Reporting Data to ESSENCE-FL by Regional Domestic Security Task Force (RDSTF), October 22, 2014 (N=216)
FIGURE 5 - FIGURE 11 describe Emergency Department (ED) and Urgent Care Center (UCC) chief complaint data from ESSENCE-FL by Regional Domestic Security Task Force (RDSTF) regions.

- ED and UCC visits for ILI in RDSTF Regions 1-5 and 7 are above levels seen during previous years at this time.
- ED and UCC visits for ILI in RDSTF Region 6 are at or near levels seen during previous years at this time.

*There is no week 53 for the 2010-2011, 2011-2012, and 2013-2014 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
**FIGURE 12** - **FIGURE 13** use BPHL viral surveillance data to track the progress of influenza infection over time. They include weekly information on how many specimens are tested by the BPHL, what proportion of those test positive for influenza and what subtypes are identified.

- **Influenza A (H3) and influenza B** have been identified by BPHL this season.
- **In recent weeks, influenza specimens submitted to BPHL tested positive for influenza B and influenza A unspecified.**
- **Influenza A (H3) has been the most common strain of influenza detected by BPHL so far in the first week of the 2014-2015 influenza season.

**TABLE 2** shows the number of specimens tested by BPHL, how many are influenza positive and their subtypes.

*Please note that lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin.
As of 11:30 a.m. October 22, 2014, a total of 67 (100%) counties reported their weekly level of influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity map for previous weeks.

Three counties reported moderate activity.

Twenty-five counties reported increasing influenza and ILI activity.

County influenza activity data are reported to BOE through EpiGateway on a weekly basis by each county influenza coordinator. Specific information is requested about laboratory results, outbreak reports and surveillance system activity. Figures 14-23, displayed below, reflect a county's assessment of influenza activity within their county as a whole as well as influenza activity within specific settings. For week 42, two counties indicated that activity was decreasing, 37 indicated activity was about the same as previous weeks and 25 indicated that activity was increasing.

**FIGURE 14** shows the assessment of the overall influenza activity trend in each county as reported by CHD influenza coordinators for week 42 as of 11:30 a.m. October 22, 2014.
Counties are asked to evaluate influenza activity in certain settings within their county. Each setting has a scale for activity that ranges from none or minimal activity to very high activity. What defines each of the values varies by facility type, but the example of the assessment in elementary, middle and high schools is included below. More detailed information on the meanings of the levels for each setting can be found on the webpage also included below.

No or very minimal activity -- Scattered cases of ILI with no increase in absenteeism or disruption of school activities.
Moderate activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in some but fewer than half of schools where it is known; occasional children sent home because of ILI.
High activity -- Absenteeism elevated above baseline (in range of 10 to 25%) in more than half of schools; most schools sending several or many children home each day because of ILI.
Very high activity -- Absenteeism high enough to force curtailment of some or all school activities.

**FIGURE 15 - FIGURE 18** show the activity levels in various facilities by county as reported by CHD influenza coordinators for week 42 as of 11:30 a.m., October 22, 2014.
FIGURE 19 - FIGURE 23 show the activity levels in various facilities by county as reported by CHD influenza coordinators for week 42 as of 11:30 a.m., October 22, 2014.

Pediatric Influenza-Associated Mortality

No influenza-associated pediatric deaths have been reported so far in week 42, or in the 2014-2015 influenza season.
FIGURE 24 shows the count of preliminary estimated pneumonia and influenza deaths for all Florida counties, the number of deaths predicted using a multi-year regression model and the upper bound of the 95% confidence interval for this prediction.

For week 41 (ending Oct 11, 2014):
- 178 preliminary estimated pneumonia and influenza deaths were reported.
- Upper bound of 95% confidence interval for prediction: 194 deaths.
- No excess deaths.

FIGURE 25 shows pneumonia and influenza deaths for all Florida counties, week 40, 2010 - week 42 2014, as reported into ESSENCE-FL. Deaths due to pneumonia and influenza are at levels seen during previous years at this time.

FIGURE 26 shows pneumonia and influenza deaths for all Florida counties by age group, week 40, 2012 - week 42, 2014, as reported into ESSENCE-FL.

Death records data reported into ESSENCE-FL are currently considered to be complete through week 41, 2014.
FIGURE 27 shows the percentage of positive tests for multiple respiratory viruses reported by NREVSS-participating laboratories in Florida.

The 6 respiratory viruses summarized in Figure 27 are:
- Respiratory Syncytial Virus (RSV)
- Parainfluenza 1-3
- Adenovirus
- Human Metapneumovirus (HMPV)
- Rhinovirus
- Influenza

Influenza and ILI Outbreaks Reported in EpiCom

In week 42, 2014, seven outbreaks of influenza or ILI were reported in to EpiCom.

Pinellas County:
- An elementary school reported 13 students and one teacher with ILI. One specimen was tested at a local health care provider and was negative by rapid antigen test for influenza. Infection prevention and control measures were discussed with facility leadership. This investigation is ongoing.

Collier County:
- An elementary school reported four students with ILI. Two specimens were collected and tested positive by rapid antigen test at the student’s health care providers. Vaccination status is unknown at this time. Infection prevention and control measures were discussed with facility leadership.
- An elementary school reported four students with ILI. Vaccination status is unknown at this time. Infection prevention and control measures were discussed with facility leadership. This investigation is ongoing.
- An assisted living facility reported five residents and one staff member with ILI. One of the ill residents was hospitalized. A specimen was collected on that resident and tested positive for influenza A by rapid antigen test. Four nasopharyngeal specimens were collected on the ill and sent to the BPHL where they tested positive by PCR for influenza A (H3) None of the ill had received the 2014-15 influenza vaccine. Infection prevention and control measures were discussed with facility leadership.

Hillsborough County:
- A daycare reported nine children with ILI. Specimens were collected and sent to BPHL, where they tested positive for Parainfluenza III. Infection prevention and control measures were discussed with facility leadership. This investigation is ongoing.
- A school reported 147 students with ILI. Nine specimens were collected and tested positive by rapid antigen test for influenza A at their local health care providers. None of the children on whom specimens were collected had received the 2014-15 influenza vaccine. Infection prevention and control measures were discussed with facility leadership. This investigation is ongoing.

Miami-Dade County:
- A daycare reported four children with ILI. Two specimens were collected tested positive for RSV at the local health care providers. Infection prevention and control measures were discussed with facility leadership.

Eight influenza outbreaks have been reported into EpiCom so far in the 2013-2014 season.

**Florida Influenza and ILI Surveillance System Summary**

**Florida ILINet**
- Measures trends in ILI visits to outpatient doctor’s offices
- Network of volunteer healthcare providers who:
  - Report ILI and total visit counts every week
  - Submit specimens for confirmatory testing

**ESSENCE-FL Syndromic Surveillance**
- Measures trends in ILI visits and hospital admissions from emergency departments and urgent care clinics
- EDs and UCCs electronically transmit visit data into ESSENCE-FL daily
- Visit data summarized in the Florida Flu Review include:
  - Percent of ED/urgent care visits due to ILI
  - Percent of ED/urgent care visitors with ILI who are admitted to the hospital

**ESSENCE-FL Vital Statistics Portal**
- Measures influenza mortality by using death certificates with pneumonia or influenza listed as a cause of death.
- Death certificate data from the Bureau of Vital Statistics can be accessed through ESSENCE-FL and are used for pneumonia and influenza mortality surveillance

**County Influenza Activity in EpiGateway**
- Uses data provided by CHDs to create a county-by-county breakdown of influenza and ILI activity around the state
- CHD epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website
- Influenza activity is classified as: No Activity, Mild, Moderate or Widespread
- Setting-specific influenza activity and influenza trend is also reported

**Outbreak Reporting in EpiCom**
- Tracks influenza and ILI outbreak investigations by CHDs and shows what types of influenza are responsible for outbreaks and where outbreaks are occurring
- CHD epidemiologists report outbreaks of influenza or ILI into EpiCom, Florida’s online disease communication system
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting

**BPHL**
- BPHL performs confirmatory testing and subtyping on surveillance specimens from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations and medical examiners

**Case-Based Influenza Surveillance**
- Pediatric Influenza-Associated Mortality
  - Deaths in children with laboratory-confirmed influenza infection are reportable in Florida
- Influenza due to Novel or Pandemic Strains
  - Patients with influenza infection due to novel or pandemic strains are reportable in Florida

**National Respiratory and Enteric Virus Surveillance System (NREVSS)**
- Measures trends in different viruses that cause respiratory disease
  - Network of laboratories who report counts of test results for common respiratory viruses, including influenza, RSV, rhinovirus and others

Information on locating influenza vaccination can be found using the flu vaccine locator at: [http://flushot.healthmap.org/](http://flushot.healthmap.org/)
