State influenza and influenza-like illness (ILI) activity:
- Florida reported sporadic activity to the Centers for Disease Control and Prevention (CDC) in week 48.
- Overall the influenza season is off to a slow start. Influenza activity remains low, although, it has increased slightly in recent weeks. Early season low activity levels are not necessarily predictive of an overall mild influenza season.
  - Thus far, influenza A (H3) is the predominately circulating strain. Seasons where influenza A (H3) is the predominately circulating strain are generally more severe, particularly in children <5 years old and adults ≥65 years old than other seasons.
  - The preliminary estimated number of deaths due to pneumonia and influenza is near levels seen in previous years at this time.
  - In week 48, one county reported moderate activity; all other counties reported mild or no influenza activity.
  - One influenza-associated pediatric death was reported in week 48.
    - This is the first reported influenza-associated pediatric death of the 2015-16 influenza season.
- In week 48, one ILI outbreak was reported in a nursing home in Hillsborough County in week 48.
- The percent of specimens testing positive for influenza at the Bureau of Public Health Laboratories (BPHL) has increased slightly but remains low in recent weeks and is below levels seen in previous years at this time. The percent of laboratory results testing positive for influenza is expected to increase as the 2015-16 influenza season progresses.
- So far in the 2015-16 season, BPHL has identified influenza A (H3) as the most commonly circulating virus so far in Florida: 64% of 25 influenza positive specimens were typed as influenza A (H3).

National influenza activity:
- National influenza activity levels are increasing but remain low.
- The predominately circulating strain identified nationally so far this season is influenza A (H3). Other strains of influenza are also circulating, but at lower levels.
- The CDC recommends flu vaccination for everyone six months of age and older as long as influenza viruses are circulating.
  - To learn more, please visit: http://www.cdc.gov/flu/weekly/.
- Highly pathogenic avian influenza (HPAI) H5 viruses have been identified in U.S. backyard and commercial flocks of birds during the spring and summer of 2015. HPAI H5 has not been identified in Florida birds, but identifications are anticipated. No human HPAI infections have been identified in Florida or the rest of the nation.
  - To learn more, please visit: www.floridahealth.gov/novelflu.
Statewide ILI Visits

Influenza-like illness (ILI) is defined as a fever ≥100°F AND sore throat and/or cough in the absence of another known cause.

**Figure 1** shows the percent of ILI visits from ED and UCC chief complaints for ESSENCE-FL participating facilities (N=259), week 40, 2012 through week 48, 2015.

The percent of visits to EDs and UCCs for ILI is below levels seen in previous years at this time.
Statewide ILI Outpatient Visits and P&I Deaths

Visits for ILI to Outpatient Providers by Flu Season
ILI = influenza-like illness

Figure 2 shows the percent of visits for ILI reported by ILINet outpatient providers statewide (n=44), week 40, 2012 through week 48, 2015.

The percent of visits to ILINet outpatient providers for ILI remains below levels seen in previous years at this time.

P&I Deaths* from Vital Statistics by Flu Season
P&I = pneumonia and influenza

Figure 3 shows P&I deaths* for all Florida counties, week 40, 2012 through week 47, 2015, from the Bureau of Vital Statistics as reported into ESSENCE-FL.

As of week 47 (ending November 28, 2015), 1,650 P&I deaths have been reported in the 2015-16 influenza season.

The number of P&I deaths is near levels seen in previous years at this time.

P&I Deaths*, Multi-Year Regression Model
P&I = pneumonia and influenza

Figure 4 shows the count of preliminary estimated P&I deaths* for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 47 (ending November 28, 2015):
159 preliminary estimated P&I deaths were reported.

The upper bound of the 95% confidence interval for prediction is 212 deaths with no excess deaths.

The number of P&I deaths are similar to levels seen in previous years at this time. P&I deaths tend to occur later in the season as at-risk populations have complications from influenza infection.

* Current season P&I death counts are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are considered to be complete through week 47, 2015.
Figures 5-7 show the number of pediatric deaths associated with influenza reported since week 40, 2011 by influenza season. One influenza-associated pediatric death was reported in week 48 in a Dade County resident. The child was unvaccinated for the 2015-16 influenza season. This is the first influenza-associated pediatric death reported in the 2015-16 influenza season.

Children, especially those with underlying health conditions, are at higher risk of severe outcomes (including death) from influenza infection. The best way to prevent influenza in children is to get them vaccinated every year. For more information please visit: http://www.cdc.gov/flu/protect/whosouldvax.htm#annual-vaccination.

County Influenza Activity

Map 1 County Influenza Activity Level for Week 48 Reported by 9:30 a.m. December 9, 2015

County Activity (N)
- No Activity (29)
- Mild Activity (37)
- Moderate Activity (1)
- Elevated Activity (0)

Map 2 County Influenza Activity Trend for Week 48 Reported by 9:30 a.m. December 9, 2015

County Trend (N)
- Decreasing (4)
- Plateau (54)
- Increasing (9)
- Unknown (0)

As of 9:30 a.m. December 9, 2015, a total of 67 (100%) counties reported their weekly level of influenza activity. Please note that data reported by counties after the deadline Tuesday at 5 p.m. are recorded but may not be included in the activity maps for this week.

Influenza-Associated Pediatric Deaths

Influenza-Associated Pediatric Deaths

FIGURES 5 - 7

Figures 5-7 show the number of pediatric deaths associated with influenza reported since week 40, 2011 by influenza season.

One influenza-associated pediatric death was reported in week 48 in a Dade County resident. The child was unvaccinated for the 2015-16 influenza season.

This is the first influenza-associated pediatric death reported in the 2015-16 influenza season.

Children, especially those with underlying health conditions, are at higher risk of severe outcomes (including death) from influenza infection. The best way to prevent influenza in children is to get them vaccinated every year. For more information please visit: http://www.cdc.gov/flu/protect/whosouldvax.htm#annual-vaccination.
Five outbreaks of influenza or ILI have been reported into EpiCom so far in the 2015-16 season. During week 48, one new outbreak was reported in Hillsborough County.

**Hillsborough County:**
A nursing home reported eight residents and one staff member with ILI. No testing was completed by local healthcare providers and no specimens were available for testing at BPHL. All ill residents were located in one of two wings of the facility. Half of residents and some staff had received the 2015-16 influenza vaccine prior to illness. Infection control measures were reviewed with facility leadership and implemented. This investigation is ongoing.

### TABLE 1: Summary of Florida Influenza and ILI Outbreaks by Setting, Week 40-48, 2015

**Figure 8** shows the distribution of outbreaks by facility type and season.

In Florida, influenza and ILI activity often increases first in children and then spreads to other age groups. As such, early season outbreaks are expected in facilities serving children, such as schools and daycares.
These figures use Bureau of Public Health Laboratories (BPHL) viral surveillance data.

**Figure 9** shows the number of influenza-positive specimens tested by subtype and lab event date*.

Influenza A (H3) is the most commonly circulating virus identified by BPHL in recent weeks. This is consistent with the national trend.

Low levels of influenza B Yamagata lineage, influenza B Victoria lineage, and influenza A (2009 H1N1) have also been identified by BPHL circulating in Florida this season.

**Figure 10** shows the number of specimens tested by BPHL and the percent that were positive for influenza by lab event date*.

The total number of specimens tested for influenza and the percent of laboratory results testing positive for influenza have remained low in recent weeks. Both indicators are below levels seen in previous years at this time.

*Lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

**Influenza A inconclusive test results are due to technical difficulties including insufficient sample for testing or internal sample control failure and occur occasionally in routine laboratory testing.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin. For instructions on how to use the Flu Lab Report, please see the Guide to Flu Lab Report on the Bureau of Epidemiology website:

Security Task Force (RDSTF) regions (see map 4) from week 40, 2012 through week 48, 2015*. **ED and UCC visits for ILI decreased or remained the same in all regions except for region 2 where visits increased. ED and UCC visits for ILI in region 7 were similar to levels seen in previous years at this time and ED and UCC visits for ILI in regions 1-6 were below levels seen in previous years at this time.**

*There is no week 53 for the 2010-2011, 2011-2012, and 2013-2014 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
Figure 19 shows the number of visits for ILI reported by ILINet outpatient providers statewide (n=44) by age group. The number of visits to ILINet outpatient providers for ILI in all age groups is below levels seen in previous years.

**Figure 18** shows the percent ILI among all ED and UCC visits by age group. ED and UCC visits for ILI overall are increasing in all age groups in recent weeks. ED and UCC ILI visits in all age groups are below levels seen in previous years at this time.

Visits to Outpatient Providers for ILI by Age Group*
ILI = influenza-like illness

*Data presented here are counts, not proportions. This is because age group denominator data is not available through ILINet.

**Figure 20** shows P&I deaths* for all Florida counties by age group, week 40, 2012 through week 47, 2015, as reported into ESSENCE-FL. The number of P&I deaths is similar to levels seen in previous years in all age groups at this time.

*Current season P&I death numbers are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are currently considered to be complete through week 47, 2015.
ESSENCE-FL collects data daily from 259 EDs and UCCs. Data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain “fever”, “cough”, and/or “sore throat”. The Florida Department of Health uses ED and UCC chief complaint data to monitor influenza and ILI activity in a timely manner in groups at higher risk of severe health outcomes (such as hospitalization and death) from influenza infection. These at-risk groups include pregnant women, children ≤18 years old, and adults ≥65 years old.

Pregnant women are at high risk for severe complications due to influenza infection. Figure 21 shows the number of visits* to EDs and UCCs with chief complaints of influenza and pregnancy.

The number of visits by pregnant women presenting to EDs and UCCs with mention of influenza has increased and is below levels seen in previous years at this time.

Figure 22 shows the percent of ILI among all ED and UCC visits for children ≤18 years old. The percent of ED and UCC visits for ILI in children ≤18 years old has remained relatively stable and remains below levels seen in previous years at this time.

Figure 23 shows the percent of ILI among all ED and UCC visits for adults ≥65 years old. The percent of ED and UCC visits for ILI in adults ≥65 years old has remained relatively stable in recent weeks and is similar to levels seen in previous years at this time.

*This count under-represents the true number of pregnant women presenting for care to EDs and UCCs with influenza. The overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.
County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity. 

**Figure 24** shows the results of the influenza activity assessment for week 48, 2015. Counties that reported “not applicable” for the listed settings are excluded from the denominator in the calculations below.

### ILI Activity by Setting Type

**ILI = influenza-like illness**

- **ILI activity levels:**
  - No or very minimal activity
  - Moderate activity
  - High activity
  - Very high activity

#### Settings for Children under 18

- **In elementary schools,** one county (1.5%) reported moderate influenza and ILI activity.
- **In daycare settings,** one county (2%) reported moderate influenza and ILI activity.

#### Settings for Adults over 65

- **In nursing homes,** 57 counties (91%) reported no or minimal influenza and ILI activity.
- **In retirement homes,** one county (2%) reported moderate influenza and ILI activity.

#### Settings for Adults ages 18 to 65

- **In colleges and universities,** one of 45 (2%) counties reported moderate influenza and ILI activity.
- **In private businesses,** one (2%) county reported moderate influenza and ILI activity.
- **In government offices,** one (2%) county reported moderate influenza and ILI activity.

#### Other Unique settings

- **In jails and prisons,** 56 (88%) counties reported no or minimal influenza and ILI activity.
- **In healthcare settings,** including rehabilitation facilities and mental health facilities, three counties (5%) reported moderate influenza and ILI activity.
Florida ILINet - Data source for figures: 2 and 19
- ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient healthcare providers. Florida has 88 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Labs (BPHL) for confirmatory testing.

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal - Data source for figures 1, 3-7, 11-18, 20-23; map 4
- ESSENCE-FL measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. EDs and UCCs electronically transmit visit data into ESSENCE-FL daily or hourly.
- For statewide and regional data on influenza-like illness, visits are counted as ED or UCC visits to participating facilities that include influenza-like illness in patient chief complaints.
- For pneumonia and influenza (P&I) surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death.

County Influenza Activity in EpiGateway - Data source for figures 19, 24, and maps 1 and 2
- County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website. Influenza activity is classified as: No Activity, Mild, Moderate or Elevated. Setting-specific influenza activity and influenza trend information is also reported. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Outbreak Reporting in EpiCom - Data source for figure 8, map 3, and table 1
- EpiCom tracks influenza and ILI outbreak investigations by county health departments. Reports by county health departments include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza or ILI into EpiCom, Florida’s online disease communication system.
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting.

Bureau of Public Health Laboratories (BPHL) - Data source for figures 9, 10 and table 2
- BPHL performs confirmatory testing and subtyping on surveillance specimens from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations and medical examiners.

National Respiratory and Enteric Virus Surveillance System (NREVSS) - Data source for figure 25
- The National Respiratory and Enteric Virus Surveillance System (NREVSS) collects data from laboratories around the country on a weekly basis. NREVSS monitors temporal and geographic patterns of six common respiratory viruses.

Case-Based Influenza Surveillance
Pediatric Influenza-Associated Mortality (Merlin) - Data source for figure 5-7

Influenza due to Novel or Pandemic Strains
- Deaths in children with laboratory-confirmed influenza infection and patients with influenza infection due to novel or pandemic strains are reportable in Florida. For more information about reportable diseases please visit www.Floridahealth.gov/
