State influenza and influenza-like illness (ILI) activity:
- Florida reported sporadic activity to the Centers for Disease Control and Prevention (CDC) in week 3.
- Overall the influenza season has been mild, however influenza activity increased in week 3. Despite current trends, low activity levels do not necessarily predict that the season will remain mild.
  - Statewide emergency department (ED) and urgent care center (UCC) ILI visits remain similar to or below levels seen in previous years at this time, although they are highest in the South East (Region 7).
  - The preliminary estimated number of deaths due to pneumonia and influenza is below levels seen in previous years at this time.
  - In week 3, most counties reported ‘mild’ or ‘no activity’.
- Twenty counties reported ‘increasing’ activity in week 3. This is up from nine in week 2.
- No influenza-associated pediatric deaths were reported in week 3.
  - Two influenza-associated pediatric deaths have been reported so far this season. While rare, Florida receives reports of influenza-associated pediatric deaths each season.
- In week 3, one outbreak of respiratory syncytial virus (RSV) was reported in a Polk County school.
- In the past six weeks, influenza A (2009 H1N1) has been the most commonly identified influenza subtype by BPHL.
  - Up until then, influenza A (H3) was the most commonly identified subtype. This change in predominately circulating strain has also been observed nationally.

National influenza activity:
- National influenza activity levels have increased slightly but remain low.
- Influenza A (2009 H1N1) is the predominately circulating strain.
- The vast majority of circulating flu viruses analyzed this season remain similar to the vaccine virus components for this season’s flu vaccines. CDC recommends an annual flu vaccine for everyone ≥6 months old. If you have not yet been vaccinated this season, get vaccinated now.
  - To learn more, please visit: www.cdc.gov/flu/weekly/.
- Highly pathogenic avian influenza (HPAI) H5 viruses have been identified in U.S. backyard and commercial flocks of birds during the spring and summer of 2015. HPAI H5 has not been identified in Florida birds, but identifications are anticipated. No human HPAI infections have been identified in Florida or the rest of the nation.
  - To learn more, please visit: www.floridahealth.gov/novelflu.
Influenza surveillance goals:

- Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual vaccine composition and to prepare for potential epidemics or pandemics.
- Surveillance is also conducted to identify unusually severe presentations of influenza infection, detect outbreaks, and determine seasonal influenza trends in order to guide influenza prevention, particularly in high-risk populations like children, the elderly, and pregnant women.
- See the back page of this report for more information on influenza surveillance systems used in Florida: Page 11 ▶

Statewide ILI Visits

Influenza-like illness (ILI) is defined as a fever ≥100°F AND sore throat and/or cough in the absence of another known cause.

Figure 1 shows the percent of visits for ILI from ED and UCC chief complaints for ESSENCE-FL participating facilities (N=260), week 40, 2012 to week 3, 2016. In week 3, the percent of visits to EDs and UCCs for ILI increased but remains below levels seen in previous years at this time.
**Statewide ILI Outpatient Visits and P&I Deaths**

**Visits for ILI to Outpatient Providers by Flu Season**

ILI = influenza-like illness

Figure 2 shows the percent of visits for ILI reported by ILINet outpatient providers statewide (n=50), week 40, 2012 to week 3, 2016.

In week 3, the percent of visits for ILI reported to ILINet outpatient providers increased but remains below levels seen in previous years at this time.

**P&I Deaths* from Vital Statistics by Flu Season**

P&I = pneumonia and influenza

Figure 3 shows P&I deaths* for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2012 to week 2, 2016.

As of week 2 (ending January 16, 2016), 3,065 P&I deaths have been reported in the 2015-16 influenza season.

The number of P&I deaths increased but is below levels seen in previous years at this time.

**P&I Deaths*, Multi-Year Regression Model**

P&I = pneumonia and influenza

Figure 4 shows the number of preliminary estimated P&I deaths* for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 2 (ending January 16, 2016):

194 preliminary estimated P&I deaths were reported.

The upper bound of the 95% confidence interval for prediction is 264 deaths, with no excess deaths.

The number of P&I deaths is below levels seen in previous years at this time. P&I deaths tend to occur later in the season as at-risk populations develop complications from influenza infection.

*Current season P&I death counts are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are considered to be complete through week 2, 2016.*
Figures 5-7 show the number of pediatric deaths associated with influenza infection, week 40, 2011 to week 3, 2016. No influenza-associated pediatric deaths were reported in week 3.

Two influenza-associated pediatric deaths have been reported this season; both occurred in unvaccinated Dade County residents. While rare, Florida receives reports of influenza-associated pediatric deaths each season. Most deaths occur in unvaccinated children with underlying health conditions.

Children, especially those with underlying health conditions, are at higher risk of severe outcomes from influenza infection. Vaccination remains the best way to protect against the flu; get children vaccinated now. To learn more please visit: www.cdc.gov/flu/protect/whoshouldvax.htm#annual-vaccination.
Six outbreaks of influenza or ILI have been reported into EpiCom so far in the 2015-16 season. One new ILI outbreak was reported in week 3.

A school in Polk County reported ten students with ILI. A specimen from one ill student tested positive for respiratory syncytial virus (RSV) by PCR at local healthcare providers. This specimen also tested negative for influenza by local healthcare providers. No specimens were available for testing at BPHL. All ill students were from one preschool classroom with children ranging from four to five years in age. Infection control measures were reviewed with facility leadership and implemented. This investigation is ongoing.

**Figure 8** shows the distribution of outbreaks by facility type and season. Facilities serving groups of at-risk populations, including the young and elderly, are more likely to report influenza and ILI outbreaks throughout the season.
These figures use BPHL viral surveillance data.

**Figure 9** shows the number of influenza-positive specimens tested by subtype and lab event date*.

In the past six weeks, influenza A (2009 H1N1) has been the most commonly identified influenza subtype by BPHL. Up until then, influenza A (H3) was the most commonly identified subtype. This change has also been observed nationally.

Low levels of influenza B Yamagata lineage and influenza B Victoria lineage have also been identified by BPHL in recent weeks.

**Figure 10** shows the number of specimens tested by BPHL and the percent that were positive for influenza by lab event date*.

In recent weeks, the number of specimens tested for influenza and the percent of laboratory results testing positive for influenza have increased. Both indicators are below levels seen in previous years at this time.

*Lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

**Influenza A inconclusive test results are due to technical difficulties including insufficient sample for testing or internal sample control failure and occur occasionally in routine laboratory testing.

Regional ILI Visits

ED and UCC Visits for ILI by Region

ED = emergency department, UCC = urgent care center, ILI = influenza-like illness

Figures 11-17 show the percent of ILI visits from ED and UCC chief complaints for ESSENCE-FL participating facilities (N=260), by ESSENCE-FL Regional Domestic Security Task Force (RDSTF) regions (map 4) from week 40, 2012 to week 2, 2016*. ED and UCC ILI visits increased in all regions except region 1 where visits remained the same. ED and UCC ILI visits in region 7 are similar to levels seen in previous years at this time, while ED and UCC ILI visits in regions 1-6 are below levels seen in previous years at this time.

*There is no week 53 for the 2012-13, 2013-14, and 2015-16 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
**Figure 18** shows the percent of visits for ILI from ED and UCC chief complaints by age group for ESSENCE-FL participating facilities (N=260), week 40, 2012 to week 3, 2016.

In week 3, ED and UCC visits for ILI increased or remained the same and are below levels seen in previous years in all age groups at this time.

---

**Figure 19** shows the number of visits for ILI reported by ILINet outpatient providers statewide (n=50) by age group, week 40, 2012 to week 3, 2016.

In week 3, the number of visits for ILI reported by ILINet outpatient providers increased in all age groups except persons ≥65 years old, which decreases slightly. Increases occurred most notably in the 5-24 age group, but overall, levels are similar to or below those seen in previous years in all age groups at this time.

---

**Figure 20** shows P&I deaths* for all Florida counties by age group, as reported into ESSENCE-FL, week 40, 2012 to week 2, 2016.

As of week 2 (ending January 16, 2016), the number of P&I deaths is similar to or below levels seen in previous years in all age groups at this time.

---

*Data presented here are counts, not proportions. This is because age group denominator data is not available through ILINet.

*Current season P&I death numbers are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are currently considered to be complete through week 2, 2016.
At-Risk Populations: ILI Visits

ESSENCE-FL collects data daily from 260 EDs and UCCs. Data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain “fever”, “cough”, and/or “sore throat”. The Florida Department of Health uses ED and UCC chief complaint data to monitor influenza and ILI activity in a timely manner in groups at higher risk of severe health outcomes (such as hospitalization and death) from influenza infection. These at-risk groups include pregnant women, children ≤18 years old, and adults ≥65 years old.

Pregnant women are at high risk for severe complications due to influenza infection.

**Figure 21** shows the number of visits* to EDs and UCCs with chief complaints of influenza infection and pregnancy, as reported into ESSENCE-FL, week 40, 2012 to week 3, 2016.

*This count under-represents the true number of pregnant women presenting for care to EDs and UCCs with influenza. The overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

In week 3, the number of visits to EDs and UCCs by pregnant women with mention of influenza remained the same and is below levels seen in previous years at this time.

**Figure 22** shows the percent of ILI visits among all ED and UCC visits for children ≤18 years old, as reported into ESSENCE-FL, week 40, 2012 to week 3, 2016.

In week 3, the percent of ILI visits among all ED and UCC visits for children ≤18 years old increased but remains below levels seen in previous years at this time.

**Figure 23** shows the percent of ILI visits among all ED and UCC visits for adults ≥65 years old, as reported into ESSENCE-FL, week 40, 2012 to week 3, 2016.

In week 3, the percent of ILI visits among all ED and UCC visits for adults ≥65 years old remained the same and is below levels seen in previous years at this time.
County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity.

**Figure 24** shows the results of the influenza activity assessment for week 3, 2016. Counties that reported “not applicable” for the listed settings are excluded from the denominator in the calculations below.

### ILI Activity by Setting Type

**ILI = influenza-like illness**

ILI activity levels:
- No or very minimal activity
- Moderate activity
- High activity
- Very high activity

**Settings for Children under 18**

- **In elementary schools**, one county (2%) reported moderate influenza and ILI activity.
- **In daycare settings**, 50 counties (86%) reported no or minimal influenza and ILI activity.

**Settings for Adults ages 18 to 65**

- **In colleges and universities**, 36 of 44 counties (82%) reported no or minimal influenza and ILI activity.
- **In private businesses**, 44 counties (85%) reported no or minimal influenza and ILI activity.
- **In government offices**, 49 counties (86%) reported no or minimal influenza and ILI activity.

**Settings for Adults over 65**

- **In nursing homes**, 56 counties (89%) reported no or minimal influenza and ILI activity.
- **In retirement homes**, 42 counties (82%) reported no or minimal influenza and ILI activity.

**Other Unique settings**

- **In jails and prisons**, 54 counties (87%) reported no or minimal influenza and ILI activity.
- **In healthcare settings**, including rehabilitation facilities and mental health facilities, one county (2%) reported moderate influenza and ILI activity.
Respiratory Virus Surveillance (Continued)

Laboratory Viral Respiratory Surveillance

Florida ILINet  ·  Data source for figures: 2 and 19
- ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient healthcare providers. Florida has 88 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Labs (BPHL) for confirmatory testing.

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal  ·  Data source for figures 1, 3-7, 11-18, 20-23; map 4
- ESSENCE-FL measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. EDs and UCCs electronically transmit visit data into ESSENCE-FL daily or hourly.
- For statewide and regional data on influenza-like illness, visits are counted as ED or UCC visits to participating facilities that include influenza-like illness in patient chief complaints.
- For pneumonia and influenza (P&I) surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death.

County Influenza Activity in EpiGateway  ·  Data source for figures 19, 24, and maps 1 and 2
- County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website. Influenza activity is classified as: No Activity, Mild, Moderate or Elevated. Setting-specific influenza activity and influenza trend information is also reported. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Outbreak Reporting in EpiCom  ·  Data source for figure 8, map 3, and table 1
- EpiCom tracks influenza and ILI outbreak investigations by county health departments. Reports by county health departments include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza or ILI into EpiCom, Florida’s online disease communication system.
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting.

Bureau of Public Health Laboratories (BPHL)  ·  Data source for figures 9, 10 and table 2
- BPHL performs confirmatory testing and subtyping on surveillance specimens from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations and medical examiners.

Laboratory Viral Respiratory Surveillance  ·  Data sources for figure 25
- The National Respiratory and Enteric Virus Surveillance System (NREVSS) and Electronic Laboratory Reporting (ELR) collect data from laboratories in Florida on a weekly basis and monitor temporal and geographic patterns of six commonly circulating respiratory viruses. NREVSS data is collected by the Centers for Disease Control and Prevention (CDC) and ELR data is collected by the Florida Department of Health (DOH).

Case-Based Influenza Surveillance

Influenza-Associated Pediatric Deaths (Merlin)  ·  Data source for figure 5-7
Influenza due to Novel or Pandemic Strains

FIGURE 25 shows the percent of laboratory results testing positive for some respiratory viruses, as reported by hospital laboratories (n=13), week 40, 2012 to week 3, 2016.

In week 3, the percent of specimens testing positive for RSV and influenza are similar to or below levels seen in previous years at this time. The percent of specimens testing positive for rhinovirus are above levels seen in previous years at this time.

- **Respiratory syncytial virus (RSV)**
- **Parainfluenza 1-3**
- **Adenovirus**
- **Human metapneumovirus**
- **Rhinovirus**
- **Influenza**
