State influenza and influenza-like illness (ILI)² activity²:

- Influenza and ILI activity have increased slightly in Florida, which is typical for this time of year.

No influenza-associated pediatric deaths were reported in weeks 33-34.

- Eight influenza-associated pediatric deaths have been reported since the start of the 2015-2016 influenza season. While rare, Florida receives reports of influenza-associated pediatric deaths each season. Annual vaccination remains the best way to protect children against influenza.

- In weeks 33 and 34, none of the 17 specimens submitted to the Bureau of Public Health Laboratories (BPHL) for influenza testing were PCR positive for influenza.

Enterovirus D68 (EV-D68) activity:

- Eight cases of EV-D68 have now been identified in Florida since February 2016. These eight cases were identified in different regions of the state and represent the full spectrum of disease. These are the first identifications of EV-D68 in the United States since the fall of 2014.

- To learn more about EV-D68, please visit: http://www.floridahealth.gov/diseases-and-conditions/d68.

National influenza activity:

- Influenza viruses continue to circulate at low levels nationally.

- In week 33, seven additional human infections with influenza A (H3N2v) were reported in Ohio and Michigan. All seven individuals reported contact with swine in fair settings in the week preceding illness onset. No person-to-person transmission has been identified.

- Eighteen human infections with influenza A (H3N2v) have been reported in the United States so far in 2016. The vast majority of human infections with variant influenza viruses do not result in person-to-person spread of disease.

- On August 25, 2016, the 2016-2017 influenza vaccine recommendations were published in a Centers for Disease Control and Prevention (CDC) Morbidity and Mortality Weekly Report. To learn more, please visit: http://www.cdc.gov/mmwr/volumes/65/rr/rr6505a1.htm?s_cid=rr6505a1_w.

- For the 2016-2017 season, CDC recommends use of inactivated influenza vaccines (IIV) or recombinant influenza vaccines (RIV). Live attenuated influenza vaccines (LAIV) should not be used during the 2016-2017 season. This recommendation follows poor or relatively lower effectiveness of LAIV between 2013 and 2016.

- While highly pathogenic avian influenza (HPAI) H5 virus identification in birds are expected later this year, that risk is lower in the summer months. HPAI H5 has not been identified in Florida birds yet, but identifications are anticipated. No human HPAI infections have been identified in Florida or other states. To learn more about HPAI, please visit: www.floridahealth.gov/novelflu.

The figure to the left shows the percent of visits for ILI from ED and UCC chief complaint data for ESSENCE-FL participating facilities (n=273) from week 40, 2012 through week 34, 2016.

The percent of ILI visits to ESSENCE-FL participating facilities increased in recent weeks but remains similar to levels seen in previous years at this time.

1. Influenza-like illness (ILI) is defined as a fever ≥ 100°F AND sore throat and/or cough in the absence of another known cause.
2. The Florida Department of Health (DOH) uses many different surveillance systems to measure influenza activity. A summary of all these systems can be found on our website at: www.floridahealth.gov/floridaflu and on page 3.
3. As of April 30, 2015, “FLS” was added to the list of abbreviations in ESSENCE-FL and is now expanded to “flu like symptoms.” As a result of this change, any visit with a chief complaint containing FLS will now code into the ILI syndrome and the influenza subsyndrome queries. Historical records have been reprocessed to reflect this change.

Influenza and ILI Outbreaks
ILI = influenza-like illness

The map on the left shows influenza and ILI outbreaks by county from week 40, 2015 (beginning on October 4, 2015) through week 34, 2016 (ending on August 27, 2016). No outbreaks of influenza or ILI were reported in weeks 33 and 34. Sixty-three outbreaks of influenza and ILI have been reported into EpiCom so far in the 2015-2016 season.

Laboratory Viral Respiratory Surveillance

The figure below shows the percentage of laboratory specimens testing positive for eight common respiratory viruses reported by the National Respiratory and Enteric Virus Surveillance System (NREVSS) and participating validated laboratories reporting results via electronic laboratory reporting (ELR) to the Florida Department of Health (DOH). Currently, 10 facilities are reporting data for the 2015-2016 season.

In week 34, the percent of specimens testing positive for parainfluenza, adenovirus, HMPV, and rhinovirus increased. These viruses circulate annually in Florida and fluctuate regularly between weeks.
ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal

- Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=273) electronically transmit ED and UCC visit data into ESSENCE-FL daily or hourly.
- For statewide and regional data on influenza-like illness, visits are counted as ED or UCC visits to participating facilities that include symptoms consistent with influenza-like illness in patient chief complaints.
- For pneumonia and influenza (P&I) surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death.

Bureau of Public Health Laboratories (BPHL)

- BPHL performs confirmatory testing and subtyping on surveillance specimens from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners.

Outbreak Reporting in EpiCom

- EpiCom tracks influenza and ILI outbreak investigations by county health departments (CHDs). Reports by CHDs include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza and ILI into EpiCom, Florida’s online disease communication system.
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting.

Laboratory Viral Respiratory Surveillance

- The National Respiratory and Enteric Virus Surveillance System (NREVSS) and Electronic Laboratory Reporting (ELR) collect data from laboratories in Florida on a weekly basis and monitor temporal and geographic patterns of six commonly circulating respiratory viruses. NREVSS data is collected by the Centers for Disease Control and Prevention (CDC) and ELR data is collected by the Florida Department of Health (DOH).

Case-Based Influenza Surveillance

- Influenza-associated pediatric deaths (reported into Merlin, DOH’s reportable disease surveillance system)
- Influenza due to novel or pandemic strains (reported into Merlin)
