State influenza and influenza-like illness (ILI) activity:
- Florida reported “widespread” activity to the Centers for Disease Control and Prevention (CDC) in week 9, this is up from “regional” activity reported in recent weeks.
- The flu season is underway and is now at near-peak levels. This is the most late-season activity we have seen in the last three seasons.
- There continues to be an increase in reported outbreaks and emergency department (ED) and urgent care center (UCC) visits for ILI remain above levels seen in previous seasons, most notably in children ≤18 years old and pregnant women.
- The preliminary estimated number of deaths due to pneumonia and influenza is similar to levels seen in previous seasons at this time.
- Forty-two counties reported “increasing” activity in week 9.
- In week 9, 25 counties reported “moderate” activity, 40 counties reported “mild” activity, and two counties reported no activity.
- No influenza-associated pediatric deaths were reported in week 9.
- Four influenza-associated pediatric deaths have been reported so far this season. While rare, Florida receives reports of influenza-associated pediatric deaths each season. Annual vaccination remains the best way to protect children against the flu.
- In week 9, five outbreaks of influenza were reported. Of these five, three occurred in Hillsborough County schools, one occurred in a Hillsborough County head start facility, and one occurred in a Manatee County preschool.
- In recent weeks, influenza A 2009 (H1N1) has been the most commonly identified influenza subtype by the Bureau of Public Health Laboratories (BPHL).

National influenza activity:
- Influenza activity has increased nationally. Thirty-three states are reporting widespread activity, an increase from 21 states in the previous week.
- The CDC has received increased reports of hospitalizations and other severe outcomes from influenza infection. Individuals at high risk of complications from influenza infection with suspected influenza should be treated with antivirals as early as possible, even prior to laboratory confirmation.
- Influenza A 2009 (H1N1) is the predominately circulating strain.
- The vast majority of circulating flu viruses analyzed this season remain similar to the vaccine virus components for this season’s flu vaccines. If you have not yet been vaccinated this season, get vaccinated now. It’s not too late!
  - The CDC reported preliminary influenza vaccine effectiveness (VE) estimates for the 2015-16 seasonal flu vaccine. Overall estimates are 59% vaccine effectiveness.
  - To learn more, please visit: www.cdc.gov/flu/weekly/.
- Highly pathogenic avian influenza (HPAI) H5 viruses have been identified in U.S. backyard and commercial flocks of birds during the spring and summer of 2015. (HPAI) H5 has not been identified in Florida birds, but identifications are anticipated. No human HPAI infections have been identified in Florida or the rest of the nation.
  - To learn more, please visit: www.floridahealth.gov/novelflu.
Influenza surveillance goals:

- Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual vaccine composition and to prepare for potential epidemics or pandemics.

- Surveillance is also conducted to identify unusually severe presentations of influenza infection, detect outbreaks, and determine seasonal influenza trends in order to guide influenza prevention, particularly in high-risk populations like children, adults ≥65 years old, and pregnant women.

- See the back page of this report for more information on influenza surveillance systems used in Florida: Page 11.

Statewide ILI Visits

Influenza-like illness (ILI) is defined as a fever ≥100°F AND sore throat and/or cough in the absence of another known cause.

Figure 1 shows the percent of visits for ILI from ED and UCC chief complaints for ESSENCE-FL participating facilities (n=261), week 40, 2012 to week 9, 2016. In week 9, the percent of visits to EDs and UCCs for ILI increased and remains above levels seen in previous seasons at this time.
Figure 2 shows the percent of visits for ILI reported by ILINet outpatient providers statewide (n=44), week 40, 2012 to week 9, 2016.

In week 9, the percent of visits for ILI reported by ILINet outpatient providers remains above levels seen in previous seasons at this time.

Figure 3 shows P&I deaths* for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2012 to week 8, 2016.

As of week 8 (ending February 27, 2016), 4,521 P&I deaths have been reported in the 2015-16 influenza season.

The number of P&I deaths increased slightly and is similar to levels seen in previous seasons at this time.

Figure 4 shows the number of preliminary estimated P&I deaths* for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 8 (ending February 27, 2016):

217 preliminary estimated P&I deaths were reported.

The upper bound of the 95% confidence interval for prediction is 286 deaths, with no excess deaths.

The number of P&I deaths is similar to levels seen in previous seasons at this time. P&I deaths tend to occur later in the season as at-risk populations develop complications from influenza infection.

* Current season P&I death counts are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are considered to be complete through week 8, 2016.
County Influenza and ILI Activity Maps

County influenza activity data are reported by county health departments through EpiGateway on a weekly basis. Information is used to determine county activity and includes laboratory results, outbreak reports, and ILI activity. The figures below reflect a county’s assessment of influenza activity within their county. For week 9, 42 counties reported “increasing” activity, 22 counties reported activity at a “plateau,” and three counties reported “decreasing” activity.

Influenza-Associated Pediatric Deaths

No influenza-associated pediatric deaths were reported in week 9.

Four influenza-associated pediatric deaths have been reported this season. While rare, Florida receives reports of influenza-associated pediatric deaths each season. Most deaths occur in unvaccinated children with underlying health conditions. Children, especially those with underlying health conditions, are at higher risk of severe outcomes from influenza infection. Annual vaccination remains the best way to protect against the flu. It is not too late to vaccinate children for the 2015-16 season. To learn more please visit: www.cdc.gov/flu/protect/whoshouldvax.htm#annual-vaccination.
Twenty-three outbreaks of influenza and ILI have been reported into EpiCom so far in the 2015-16 season. Five outbreaks of influenza were reported in week 9. Infection control measures were reviewed with facility leadership. No specimens were available for testing at BPHL.

Hillsborough County:
- An elementary school reported 20 students with ILI. Two specimens collected from ill students tested positive for influenza by rapid antigen testing at local health care providers; one for influenza A and one for influenza B. Vaccination status for ill students for the 2015-16 season is unknown. This investigation is ongoing.
- A head start facility reported 11 students with ILI. Two specimens collected from ill students tested positive for influenza A by rapid antigen testing at local health care providers. Vaccination status for ill students for the 2015-16 season is unknown. This investigation is closed.
- An elementary school reported 13 students and one staff member with ILI. Four specimens collected from ill individuals tested positive for influenza A by rapid antigen testing at local health care providers. Of the ill individuals, five were vaccinated for the 2015-16 season. This investigation is closed.
- A K-8 school reported 21 students and two staff members with ILI. Five specimens collected from ill individuals tested positive for influenza A by rapid antigen testing at local health care providers. Vaccination status for ill individuals for the 2015-16 season is unknown. This investigation is closed.

Manatee County:
- A preschool reported five students with ILI. Two specimens collected from ill students tested positive for influenza A by rapid antigen testing at local health care providers. All ill students were unvaccinated for the 2015-16 season. This investigation is ongoing.

Figure 8 shows the distribution of outbreaks by facility type and season.

Influenza activity typically increases in children before older age groups. Therefore, outbreaks in facilities serving children are expected at this time in the season.
These figures use BPHL viral surveillance data.

Figure 9 shows the number of influenza-positive specimens, tested by subtype and lab event date*. In recent weeks, influenza A 2009 (H1N1) has been the most commonly identified influenza subtype by BPHL. In the early part of the 2015-16 influenza season, influenza A (H3) was the most commonly identified subtype. This change has also been observed nationally. Influenza B Yamagata lineage and influenza B Victoria lineage have also been identified by BPHL this season.

Figure 10 shows the number of specimens tested by BPHL and the percent that were positive for influenza by lab event date*. In recent weeks, the number of specimens tested for influenza and the percent of laboratory results testing positive for influenza have increased. Both indicators are similar to or above levels seen in previous seasons at this time.

*Lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

**Influenza A inconclusive test results are due to technical difficulties including insufficient sample for testing or internal sample control failure and occur occasionally in routine laboratory testing.

For county-specific laboratory data, please refer to the Flu Lab Report in Merlin. For instructions on how to use the Flu Lab Report, please see the Guide to Flu Lab Report on the Bureau of Epidemiology website:

*Lab event date is defined as the earliest of the following dates associated with the lab: date specimen collected, date received by the laboratory, date reported or date inserted.

**Influenza A inconclusive test results are due to technical difficulties including insufficient sample for testing or internal sample control failure and occur occasionally in routine laboratory testing.
Regional ILI Visits

**ED and UCC Visits for ILI by Region**

ED = emergency department, UCC = urgent care center, ILI = influenza-like illness

Figures 11-17 show the percent of visits for ILI from ED and UCC chief complaints for ESSENCE-FL participating facilities (n=261), by ESSENCE-FL Regional Domestic Security Task Force (RDSTF) regions (see map 4) from week 40, 2012 to week 9, 2016*. In week 9, ED and UCC ILI visits increased in all regions except for region 2 where the percent of visits decreased. ED and UCC visits are above levels seen in previous seasons in all regions except for regions 1 and 2 where levels are similar to those seen in previous seasons at this time.

*There is no week 53 for the 2012-13, 2013-14, and 2015-16 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

---

**MAP 4**

Emergency Departments (EDs) and Urgent Care Centers (UCCs) Reporting Data to ESSENCE-FL by Regional Domestic Security Task Force (RDSTF), March 9, 2016 (n=261)

- Urgent Care Centers
- Hospitals
Figure 19 shows the number of visits for ILI reported by ILINet outpatient providers statewide (n=44) by age group, week 40, 2012 to week 9, 2016. In week 9, the number of visits for ILI is above levels seen in previous seasons in the 5-24 and 25-64 age groups. The number of visits for ILI is similar to levels seen in previous seasons in the 0-4 and ≥65 age groups.

Figure 18 shows the percent of visits for ILI from ED and UCC chief complaints by age group for ESSENCE-FL participating facilities (N=261), week 40, 2012 to week 9, 2016. In week 9, ED and UCC visits for ILI are above levels seen in previous seasons in all age groups at this time.

Figure 20 shows P&I deaths* for all Florida counties by age group, as reported into ESSENCE-FL, week 40, 2012 to week 8, 2016. As of week 8 (ending February 27, 2016), the number of P&I deaths in the 5-24 and 25-64 groups increased slightly. The number of P&I deaths decreased in the ≥65 age group and remained the same in the 0-4 age group. Levels are similar to those seen in previous seasons for all age groups at this time.

*Data presented here are counts, not proportions. This is because age group denominator data is not available through ILINet.

*Current season P&I death numbers are preliminary estimates, and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are currently considered to be complete through week 8, 2016.
At-Risk Populations: ILI Visits

ESSENCE-FL collects data daily from 261 EDs and UCCs. Data are processed into 11 different syndrome categories based on the patient's chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words "influenza" or "flu," or complaints that contain “fever,” “cough,” and/or “sore throat.” The Florida Department of Health uses ED and UCC chief complaint data to monitor influenza and ILI activity in a timely manner in groups at higher risk of severe health outcomes (such as hospitalization and death) from influenza infection. These at-risk groups include pregnant women, children ≤18 years old, and adults ≥65 years old.

### ED and UCC Visits for ILI by Pregnant Women

Pregnant women are at high risk for severe complications due to influenza infection.

**Figure 21** shows the number of visits* to EDs and UCCs with chief complaints of influenza infection and pregnancy, as reported into ESSENCE-FL, week 40, 2012 to week 9, 2016.

In week 9, the number of visits to EDs and UCCs by pregnant women with mention of influenza increased and is above levels seen in previous seasons at this time.

*This count under-represents the true number of pregnant women presenting for care to EDs and UCCs with influenza. The overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.

### ED and UCC Visits for ILI by Children ≤18 Years Old

**Figure 22** shows the percent of ILI visits among all ED and UCC visits for children ≤18 years old, as reported into ESSENCE-FL, week 40, 2012 to week 9, 2016.

In week 9, the percent of ILI visits among all ED and UCC visits for children ≤18 years old increased and is above levels seen in previous seasons at this time. Increased activity in children typically comes ahead of increased activity in older age groups.

### ED and UCC Visits for ILI by Adults ≥65 Years Old

**Figure 23** shows the percent of ILI visits among all ED and UCC visits for adults ≥65 years old, as reported into ESSENCE-FL, week 40, 2012 to week 9, 2016.

In week 9, the percent of ILI visits among all ED and UCC visits for adults ≥65 years old remained the same and is above levels seen in previous seasons at this time.
County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity.

Figure 24 shows the results of the influenza activity assessment for week 9, 2016. Counties that reported “not applicable” for the listed settings are excluded from the denominator in the calculations below.

### ILI Activity Levels:
- No or very minimal activity
- Moderate activity
- High activity
- Very high activity

### Settings for Children under 18
- In **elementary schools**, 14 counties (21%) reported moderate influenza or ILI activity.
- In **daycare settings**, one county (2%) reported moderate influenza or ILI activity.

### Settings for Adults over 65
- In **nursing homes**, three counties (5%) reported moderate influenza or ILI activity.
- In **retirement homes**, one county (2%) reported moderate influenza or ILI activity.

### Settings for Adults ages 18 to 65
- In **colleges**, one county (2%) reported moderate influenza or ILI activity.
- In **businesses**, one county (2%) reported moderate influenza or ILI activity.
- In **government offices**, one county (2%) reported moderate influenza or ILI activity.

### Other Unique settings
- In **jails and prisons**, two counties (3%) reported moderate influenza or ILI activity.
- In **health care settings**, including rehabilitation facilities and mental health facilities, 16 counties (25%) reported moderate influenza or ILI activity.
Florida ILI Surveillance System Summary

**Florida ILINet** - Data source for figures: 2 and 19
- ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 88 sentinel providers enrolled in ILINet who submit weekly ILI and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Labs (BPHL) for confirmatory testing.

**ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal** - Data source for figures 1, 3-7, 11-18, 20-23; map 4
- ESSENCE-FL measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. EDs and UCCs electronically transmit visit data into ESSENCE-FL daily or hourly.
- For statewide and regional data on influenza-like illness, visits are counted as ED or UCC visits to participating facilities that include influenza-like illness in patient chief complaints.
- For pneumonia and influenza (P&I) surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death.

**County Influenza Activity in EpiGateway** - Data source for figures 19, 24, and maps 1 and 2
- County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website. Influenza activity is classified as: No Activity, Mild, Moderate or Elevated. Setting-specific influenza activity and influenza trend information is also reported. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

**Outbreak Reporting in EpiCom** - Data source for figure 8, map 3, and table 1
- EpiCom tracks influenza and ILI outbreak investigations by county health departments. Reports by county health departments include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza or ILI into EpiCom, Florida’s online disease communication system.
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting.

**Bureau of Public Health Laboratories (BPHL)** - Data source for figures 9, 10 and table 2
- BPHL performs confirmatory testing and subtyping on surveillance specimens from ILINet sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations and medical examiners.

**Laboratory Viral Respiratory Surveillance** - Data sources for figure 25
- The National Respiratory and Enteric Virus Surveillance System (NREVSS) and Electronic Laboratory Reporting (ELR) collect data from laboratories in Florida on a weekly basis and monitor temporal and geographic patterns of six commonly circulating respiratory viruses. NREVSS data is collected by the Centers for Disease Control and Prevention (CDC) and ELR data is collected by the Florida Department of Health (DOH).

**Case-Based Influenza Surveillance**
- Influenza-Associated Pediatric Deaths (Merlin) - Data source for figure 5-7
- Influenza due to Novel or Pandemic Strains (Merlin)
