County Influenza Activity

During week 41, influenza activity increased but remained at low levels overall across the state, although preliminary data indicate some high-risk subpopulations are seeing larger increases. Influenza activity is expected to increase in the coming weeks as we head into the fall and winter months.

- The number of emergency department (ED) and urgent care center (UCC) visits for ILI among pregnant women increased notably and was above levels observed in previous seasons at this time. Influenza is five times more likely to cause severe illness in pregnant women than in women who are not pregnant. Inactivated influenza vaccines are safe and offer the best protection against influenza infection for pregnant women and their babies. Pregnant women who have not been vaccinated should get vaccinated now.

- Florida reported sporadic activity to the Centers of Disease Control and Prevention (CDC) in week 41.

- No influenza-associated pediatric deaths were reported. No influenza-associated pediatric deaths have been reported so far during the 2017-18 season.

- During the 2016-17 influenza season, 11 influenza-associated pediatric deaths were reported. Annual vaccination remains the best way to protect children against influenza. Now is the perfect time to get vaccinated.

- The majority of counties reported no influenza activity or mild influenza activity. Only one county reported moderate influenza activity.

- One outbreak of influenza A was reported. The number of influenza A outbreaks reported in recent weeks remained steady. It is not unusual to detect sporadic outbreaks of influenza early in the season. Detection of early season outbreaks can be useful for identifying the circulation of unusual or more severe strains of influenza. At this point in the influenza season, it is still not possible to make predictions about the severity or time of peak activity based on these outbreak reports.

- Since July, the most common influenza subtype detected at the Bureau of Public Health Laboratories (BPHL) has been influenza A (H3). It is still too early to say if influenza A (H3) will continue to predominate throughout the season.

- Respiratory syncytial virus (RSV) activity in children <5 years increased, and has remained higher than levels observed in previous seasons for several weeks in a row (see page 12).

National influenza activity:

- Influenza activity remains at low levels nationally.

- Consistent with the trend observed in Florida, influenza A (H3) has been the most common influenza subtype reported to the Centers for Disease Control and Prevention (CDC) by public health laboratories across the nation since July.

- The CDC Advisory Committee on Immunization Practices (ACIP) voted in favor of the recommendation that live attenuated influenza vaccine (LAIV) should not be used during the 2017-18 influenza season. This recommendation follows concerns about lower effectiveness of LAIV during the 2013-14 and 2015-16 influenza seasons against influenza A 2009 (H1N1) viruses. The ACIP continues to recommend annual influenza vaccination with either the inactivated influenza vaccine (IIV) or recombinant influenza vaccine (RIV) for everyone aged six months and older.

- There is an increased risk for highly pathogenic avian influenza (HPAI) virus identification in birds as we enter the fall migratory season. HPAI has not been identified in Florida birds (and would be expected to be observed in northern states first), but identifications are possible. No human HPAI infections have been identified in Florida or any other states.

- To learn more about HPAI, please visit: www.floridahealth.gov/novelflu.
Statewide ILI Visits

**ED and UCC Visits for ILI by Flu Season**

ED = emergency department, UCC = urgent care center, ILI = influenza-like illness

**Figure 1**

Figure 1 shows the percent of visits for ILI from ED and UCC chief complaint data for ESSENCE-FL participating facilities (n=308), week 40, 2014 to week 41, 2017.

In week 41, the percent of visits to EDs and UCCs for ILI increased and was similar to levels seen in previous seasons at this time, although some high-risk subpopulations are seeing notable increases and early season activity (see page 10). This trend will be monitored carefully.

The ESSENCE-FL ILI syndrome is composed of chief complaints that include the words “influenza” or “flu,” or chief complaints that include the words “fever” and “cough,” or “fever” and “sore throat.” For more information on ESSENCE-FL, see page 10.

---

**Influenza surveillance goals:**

- Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual national vaccine composition and to prepare for potential epidemics or pandemics.
- Surveillance is also conducted to identify unusually severe presentations of influenza infection, detect outbreaks, and determine seasonal influenza trends in order to guide influenza prevention, particularly in high-risk populations like children, adults ≥65 years old, and pregnant women. These activities are particularly important at the start of flu season in order to identify potential changes in circulating influenza strains.

Note: Surveillance case definitions for influenza-like illness (ILI) vary across surveillance systems. For more information on influenza surveillance systems and associated case definitions used in Florida, see page 14.

---

**Weekly State Influenza Activity Reporting**

Below is the state influenza activity level reported to CDC each week since the 2013-14 influenza season. **Florida reported sporadic influenza activity for week 41.**

Fs the state influenza activity level reported to CDC each week since the 2013-14 influenza season. **Florida reported sporadic influenza activity for week 41.**

Influenza activity in Florida can vary widely from season to season. This unpredictability underscores the importance of influenza surveillance in Florida.
Statewide ILI Outpatient Visits and P&I Deaths

Visits for ILI to Outpatient Providers by Flu Season

*ILI = influenza-like illness*

**Figure 2** shows the percent of visits for ILI reported by ILINet outpatient providers statewide (n=44), week 40, 2014 to week 41, 2017. For ILINet, influenza-like illness (ILI) is defined as a fever ≥100°F AND sore throat and/or cough in the absence of another known cause.

In week 41, the percent of visits for ILI reported by ILINet outpatient providers decreased and was slightly below levels seen in previous seasons at this time.

P&I Deaths* from Vital Statistics by Flu Season

*P&I = pneumonia and influenza*

**Figure 3** shows P&I deaths* for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2014 to week 40, 2017.

During the first week of the 2017-18 flu season (week 40), 177 P&I deaths were reported.

The preliminary number of P&I deaths decreased and was similar to levels seen in previous seasons at this time.

P&I Deaths*, Multi-Year Regression Model

*P&I = pneumonia and influenza*

**Figure 4** shows the number of preliminary estimated P&I deaths* for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 40 (ending October 7, 2017), 177 preliminary estimated P&I deaths were reported, which is below the expected number of deaths (215) for week 40.

*Current season P&I death counts are preliminary estimates and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are considered to be complete through week 40, 2017.*
Figures 5 - 7 show the number of pediatric deaths associated with influenza infection, week 40, 2013 to week 41, 2017. In week 41, no influenza-associated pediatric deaths were reported. No influenza-associated pediatric deaths have been reported so far during the 2017-18 season. Eleven influenza-associated pediatric deaths were reported last season.

While rare, Florida receives reports of influenza-associated pediatric deaths each season. Most deaths occur in unvaccinated children with underlying health conditions. Children, especially those with underlying health conditions, are at higher risk of severe outcomes from influenza infection.

Annual vaccination remains the best way to protect against influenza. Now is the perfect time to get vaccinated. CDC recommends vaccination as long as influenza viruses are circulating. To learn more, please visit: www.cdc.gov/flu/protect/whosouldvax.htm#annual-vaccination.

As of 9:30 a.m. October 18, 2017, a total of 67 (100%) counties reported their weekly level of influenza activity. Please note that data reported after the deadline (Tuesday at 5 p.m.) are recorded but may not be included in the activity maps for this week.

**Influenza-Associated Pediatric Deaths**

**Figure 5: Influenza-Associated Pediatric Deaths by Vaccination Status**

- Unvaccinated
- Vaccinated
- Vaccination unknown

**Figure 6: Influenza-Associated Pediatric Deaths by Medical History**

- No known underlying conditions
- Underlying health conditions

**Figure 7: Influenza-Associated Pediatric Deaths by Strain Type**

- Influenza A (H3)
- Influenza A 2009 (H1N1)
- Influenza A unsubtyped
- Influenza B
- Influenza subtyping not performed
Note: Colleges and universities, private businesses, local and state government offices, retirement homes, and other settings have not reported any outbreaks during this season.

The setting categorized as "Other" includes hotels, home schools, mental health facilities, residential treatment facilities, and rehabilitation facilities.

*Outbreak etiology is updated for two weeks after initial report.

### Figure 8

This figure shows the distribution of outbreaks by facility type and season. In week 41, one outbreak of influenza A was reported. The majority of outbreaks reported so far during the 2017-18 season have been reported in facilities serving adults ≥65 years old.

For more detailed information on influenza and ILI outbreaks reported in week 41, see page 6. Data presented on outbreaks are preliminary and subject to change as outbreak investigations progress.

Map 3 shows influenza and ILI outbreaks by county for week 40, 2017 through week 41, 2017, as reported into Merlin.

In week 41, one outbreak of influenza A was reported in Merlin.

A steady number of influenza A outbreaks have been reported each week. While early season outbreaks are expected, the detection of these early outbreaks is important as it can serve as early indicators of unusual or more severe strains of influenza. At this point in the influenza season, it is still not possible to make any predictions about the severity or timing of peak influenza activity based on these early outbreak reports.
In week 41, one outbreak of influenza A was reported into Merlin.

**Martin County:**
- **A nursing facility** reported nine residents and one staff member with ILI. Nine individuals tested positive for influenza A by rapid antigen testing at local health care providers. One individual tested positive for influenza B by rapid antigen testing at a local health care provider. No specimens were available for testing at BPHL. Vaccination status for all residents and staff members is unknown. Infection control measures were reviewed with facility leadership. This investigation is closed.

In week 40 (ending October 7, 2017), three outbreaks were reported into Merlin. During week 41, all three outbreaks were updated.

**Monroe County:**
- **A shelter** for persons displaced by Hurricane Irma reported 15 residents with ILI. Four specimens were collected for testing at BPHL. Of those, two tested positive for influenza A by PCR. Subtyping results are still pending. The shelter reported that six staff members and 20 residents were vaccinated for the 2017-18 influenza season. Infection control measures were reviewed with facility leadership. This investigation is closed. **Update:** Two specimens were subtyped as influenza A (H3) at BPHL.

**St. Lucie County:**
- **A long-term care facility** reported 42 residents and 14 staff members with ILI. Five individuals sought treatment at a local ED. Nineteen individuals tested positive for influenza (type unknown) by rapid antigen at local health care providers. No specimens have been available for testing at BPHL thus far. Vaccination status for the 2017-18 influenza season for all residents and staff members is currently unknown. Infection control measures were reviewed with facility leadership. This investigation is ongoing. **Update:** Five specimens were collected for testing at BPHL. Those results are pending. This investigation is still ongoing.

**Pinellas County:**
- **A skilled nursing facility** reported four residents and one staff member with ILI. Vaccination status for the 2017-18 influenza season for all residents and staff members is currently unknown. Infection control measures were reviewed with facility leadership. This investigation is ongoing. **Update:** Two individuals were hospitalized as a result of their illnesses. No specimens were available for testing at BPHL. The etiology of this outbreak is unknown. This investigation is now closed.
Figures 9 and 10 use BPHL viral surveillance data.

**Figure 9** shows the number of influenza-positive specimens tested by subtype and lab event date.*

The most common influenza subtype detected at BPHL statewide for the 2016-17 influenza season has been influenza A (H3). Seasons in which A (H3) viruses predominate are associated with more severe illness in young children and adults ≥65 years old. It is still too early to say if influenza A (H3) will continue to predominate throughout the season.

**Figure 10** shows the number of specimens tested by BPHL and the percent that were positive for influenza by lab event date*. In week 41, the percent of specimens testing positive for influenza decreased and was similar to levels observed in previous seasons at this time.

*“Lab event date” is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

There is no week 53 for the 2013-14, 2015-16, and 2016-17 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.

**Regional ILI Visits**

**Figure 11-17** show the percent of visits for ILI from ED and UCC chief complaints for ESSENCE-FL participating facilities (n=308), by ESSENCE-FL Regional Domestic Security Task Force (RDSTF) regions (see map 4) from week 40, 2014 to week 41, 2017*. In week 41, the percent of ED and UCC visits for ILI decreased in region 1 and increased in all other regions. ILI activity in all regions was similar to or below levels observed in previous seasons at this time.

*There is no week 53 for the 2013-14, 2015-16, and 2016-17 seasons; the week 53 data point for those seasons is an average of weeks 52 and 1.
Visits to Outpatient Providers for ILI by Age Group*

ILI = influenza-like illness

*Data presented here are counts, not proportions. This is because age group denominator data is not available through ILINet.

P&I Deaths* from Vital Statistics by Age Group

P&I = pneumonia and influenza

*Current season P&I death numbers are preliminary estimates and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are currently considered to be complete through week 40, 2017.
ESSENCE-FL collects data daily from 308 EDs and UCCs. Data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words "influenza" or "flu," or complaints that contain “fever” and “cough,” or “fever” and “sore throat.” The Florida Department of Health uses ED and UCC chief complaint data to monitor influenza and ILI activity in a timely manner in groups at higher risk of severe health outcomes (such as hospitalization and death) from influenza infection. These at-risk groups include pregnant women, children ≤18 years old, and adults ≥65 years old.

Figure 21 shows the number of visits* to EDs and UCCs with chief complaints of influenza infection and pregnancy, as reported into ESSENCE-FL, week 40, 2014 to week 41, 2017. In week 41, the number of visits to EDs and UCCs by pregnant women with mention of influenza increased notably. Levels were above those observed in previous seasons at this time. This trend will be monitored carefully.

Figure 22 shows the percent of ILI visits among all ED and UCC visits for children ≤18 years old, as reported into ESSENCE-FL, week 40, 2014 to week 41, 2017. In week 41, the percent of ILI visits among all ED and UCC visits for children ≤18 years old increased and was similar to levels observed in previous seasons at this time.

Figure 23 shows the percent of ILI visits among all ED and UCC visits for adults ≥65 years old, as reported into ESSENCE-FL, week 40, 2014 to week 41, 2017. In week 41, the percent of ILI visits among all ED and UCC visits for adults ≥65 years old increased. Levels were similar to those observed in previous seasons at this time.

*This count under-represents the true number of pregnant women presenting for care to EDs and UCCs with influenza. The overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.
County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity.

Figure 24 shows the results of the influenza activity assessment for week 40, 2017. Counties that reported “not applicable” for the listed settings are excluded from the denominator in the calculations below.

**ILI Activity Levels:**
- No or very minimal activity
- Moderate activity
- High activity
- Very high activity

**Settings for Children <18 Years Old**

In elementary schools, 56 counties (84.8%) reported no or minimal influenza or ILI activity. One county (1.5%) reported moderate influenza or ILI activity.

In daycare settings, 50 counties (84.7%) reported no or minimal influenza or ILI activity.

**Settings for Adults >65 Years Old**

In nursing homes, 50 counties (80.6%) reported no or minimal influenza or ILI activity. One county (1.6%) reported moderate influenza or ILI activity.

In retirement homes, 44 counties (80.0%) reported no or minimal influenza or ILI activity.

**Settings for Adults 18 to 65 Years Old**

In colleges, 32 of 42 counties (76.2%) reported no or minimal influenza or ILI activity.

In businesses, 39 counties (75.0%) reported no or minimal influenza or ILI activity.

In government offices, 44 counties (80.0%) reported no or minimal influenza or ILI activity.

**Other Unique Settings**

In jails and prisons, 51 counties (85.0%) reported no or minimal influenza or ILI activity.

In health care settings, including rehabilitation facilities and mental health facilities, 57 counties (87.7%) reported no or minimal influenza or ILI activity.
RSV Activity Summary and Seasonality

RSV activity:
- In week 41, the percent of children <5 years old diagnosed with RSV at EDs and UCCs increased and was above levels observed in previous seasons at this time.
- RSV activity this fall has remained higher than levels observed in previous seasons for several weeks in a row. All regions are currently in RSV season.
- To learn more about RSV in Florida, please visit: http://www.floridahealth.gov/rsv.

RSV Seasonality:
- RSV activity in Florida typically peaks in November through January, though activity can vary dramatically by region. According to CDC, the start of RSV season is marked by the first two consecutive weeks during which the average percentage of specimens testing positive for RSV is ≥10%.
- Florida has established regular RSV seasons based on these thresholds.
- Florida’s RSV season is longer than the rest of the nation and has distinct regional seasonality. For more information on RSV seasonality in Florida, see the American Academy of Pediatrics’ (AAP) 2015 Red Book.

RSV surveillance goals:
- A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants. The determination of unique seasonal and geographic trends of RSV activity has important implications as it relates to prescribing patterns for initiating prophylaxis to children at high risk for RSV infection. The AAP currently recommends that preapproval for prophylactic treatment be made based on state surveillance data.
- See the back page of this report for more information on RSV surveillance systems used in Florida: page 14.

ED and UCC Visits for RSV by Children <5 Years Old

ED = emergency department, UCC = urgent care center, RSV = respiratory syncytial virus

**Figure 25** shows the percent of visits to EDs and UCCs with discharge diagnoses that include RSV or RSV-associated illness, as reported by participating ESSSENCE-FL facilities (n=308), week 30, 2014 to week 41, 2017.

In week 41, the percent of children presenting to participating EDs and UCCs for care with RSV increased and was above levels observed in previous seasons at this time.

**Laboratory RSV Surveillance**

RSV = respiratory syncytial virus

**Figure 26** shows the percent of laboratory results testing positive for RSV, as reported by hospital laboratories (n=9), week 30, 2014 to week 41, 2017.

In week 41, the percent of specimens testing positive for RSV decreased slightly and was below levels observed in previous seasons at this time.
Other Respiratory Virus Surveillance

Statewide activity:

- In week 41, the percent of specimens testing positive for rhinovirus, human metapnuemovirus (MPV), adenovirus, and parainfluenza 1-3 increased.

- The percent of specimens testing positive for RSV and rhinovirus remained higher than other respiratory viruses under surveillance.

Enterovirus D68 (EV-D68) activity:

- In week 41, no new cases of EV-D68 were identified in Florida.

  - One case of EV-D68 has been identified in Florida so far in 2017. The case was retrospectively identified when a specimen collected from an outbreak reported in week 33 (ending August 19, 2017) tested positive for EV-D68 by PCR at BPHL. No additional specimens collected during this outbreak investigation were positive for EV-D68.

  - To learn more about EV-D68, please visit: http://www.floridahealth.gov/diseases-and-conditions/d68.

Outbreaks:

- In week 41, no outbreaks of RSV, parainfluenza, adenovirus, MPV, rhinovirus, enterovirus, or coronavirus were reported.

Laboratory Viral Respiratory Surveillance

Figure 27 shows the percent of laboratory results testing positive for eight common respiratory viruses, as reported by hospital laboratories (n=9), week 40, 2014 to week 41, 2017.

In week 41, the percent of specimens testing positive RSV and rhinovirus remained higher than other respiratory viruses under surveillance.

Non-Influenza ARIES Laboratory Outpatient Surveillance*

ARIES = Acute Respiratory Infection Epidemiology and Surveillance Program

Figure 28 shows the number of specimens testing positive for 12 common respiratory viruses, as reported by BPHL and ARIES outpatient providers statewide (n=7), week 40, 2016 to week 40, 2017.

In week 40 (ending October 7, 2017), specimens submitted by ARIES providers tested positive for RSV, parainfluenza 1, rhinovirus, and coronavirus NL63.

*Data presented here are counts, not proportions. The most recent data available are displayed here. ARIES laboratory data are currently considered to be complete through week 40, 2017. Laboratory results for specimens that have not yet been tested in full will be included in future reports.
Florida ILINet - Data source for figures 2 and 19
- ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 88 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing.

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal - Data source for figures 1, 3-7, 11-18, 20-23, 25; map 4
- Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=308) electronically transmit visit data into ESSENCE-FL daily or hourly.
- For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words “influenza” or “flu” in patient chief complaints. Chief complaints with the words “fever” and “cough,” or “fever” and “sore throat” are also counted as ILI.
- For pneumonia and influenza (P&I) surveillance, death record literals are queried using a free-text query that searches for references to P&I on death certificates. Any mention of P&I in the death certificate literals, with certain exceptions, is counted as a P&I death.
- For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities for which RSV or RSV-associated illness is included in the discharge diagnosis. Death record literals are also queried using a free-text query that searches for references to RSV on death certificates for children <18 years old. Any mention of RSV in the death certificate literals, with certain exceptions, is counted as an RSV-associated pediatric death.

County Influenza Activity in EpiGateway - Data source for figures 19, 24, and maps 1 and 2
- County health department (CHD) epidemiologists report their county’s influenza and ILI surveillance data weekly into the EpiGateway website. Influenza activity is classified as: no activity, mild, moderate, or elevated. Setting-specific influenza activity and influenza trend information is also reported. EpiGateway data provided by CHDs creates a county-by-county breakdown of influenza and ILI activity around the state.

Outbreak Reporting in Merlin - Data source for figure 8, map 3, and table 1
- Merlin tracks influenza and ILI outbreak investigations by CHDs. Reports by CHDs include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza or ILI into Merlin, Florida’s reportable disease surveillance system.
- Outbreaks are defined as two or more cases of influenza or ILI in a specific setting.

Bureau of Public Health Laboratories (BPHL) - Data source for figures 9, 10 and table 2
- BPHL performs confirmatory testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners.

Laboratory Viral Respiratory Surveillance - Data sources for figures 26-27
- The National Respiratory and Enteric Virus Surveillance System (NREVSS) and Electronic Laboratory Reporting (ELR) collect data from laboratories in Florida on a weekly basis and monitor temporal and geographic patterns of eight commonly circulating respiratory viruses. NREVSS data is collected by the Centers for Disease Control and Prevention (CDC) and ELR data is collected by the Florida Department of Health (DOH).

Acute Respiratory Infection Epidemiology and Surveillance (ARIES) Program - Data source for figure 28
- Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) is a nationwide surveillance system composed of nine participating jurisdictions. Florida has seven sentinel providers enrolled in ARIES who submit weekly ILI and ARI (acute respiratory infection) counts, as well as submit ARI and ILI specimens to BPHL for testing.

Case-Based Influenza Surveillance
- Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child’s death is reportable in Florida. Influenza-associated pediatric deaths are documented by CHDs in Merlin.
- In addition, an individual of any age infected with novel or pandemic influenza strain(s) is reportable in Florida. Pandemic strain influenza cases are documented by CHDs in Merlin.
- For more information about reportable diseases, please visit www.Floridahealth.gov/diseasereporting.
