Summary

Week 20: May 13-19, 2018

State influenza and influenza-like illness (ILI) activity:

- Week 20 marks the end of the production of the weekly influenza report. The Florida Department of Health will continue to distribute influenza reports in an abbreviated format during the summer months on a biweekly basis. RSV surveillance information will continue to be included in these biweekly reports. Surveillance for influenza will continue during the summer months with a focus on identification of outbreaks and unusually severe presentations of influenza or ILI.

- The influenza season is coming to a close. Statewide, influenza and ILI activity continued to decrease and remained at normal levels for this time. While activity has declined overall, it is important to note that influenza continues to circulate at low levels throughout the summer months in Florida and may cause outbreaks.

- Data indicate influenza activity this season peaked during week 5 (ending February 3, 2018). Peak influenza activity this season was higher than in past flu seasons.

- No new influenza-associated pediatric deaths were confirmed in week 20. Eight influenza-associated pediatric deaths have been confirmed since the start of the 2017-18 influenza season. The number of confirmed influenza-associated pediatric deaths ranged from three to 11 during the last five flu seasons.

- Deaths due to pneumonia and influenza (P&I) were below expected levels. Deaths due to P&I also peaked during week 5.

- Two outbreaks of influenza or ILI were reported in week 20: one with laboratory confirmation of influenza and one ILI. A total of 507 outbreaks of influenza and ILI have been reported since the start of the 2017-18 season. More outbreaks were reported this season than in previous seasons on record. An average of 91 total influenza or ILI outbreaks were reported during the last five seasons.

- In week 20, two cases of intensive-care unit patients aged <65 years with laboratory-confirmed influenza were reported; 378 cases have been reported since February 1, 2018.

- Of the 242 cases with known vaccination status, the majority (69%) were unvaccinated individuals. Of the 374 cases with medical histories available, the majority (89%) had underlying medical conditions.

Prevention and Treatment:

- The Florida Department of Health recommends that sick people stay home until fever-free for at least 24 hours (without the use of fever-reducing medication) and that all people use good handwashing practices.

National influenza activity:

- Influenza activity decreased and remained below the national baseline.

- As in Florida, influenza A (H3) has been the most common strain of influenza identified for the season; however, influenza B viruses have been more frequently reported than influenza A viruses since early March.

- This late-season circulation of influenza B is expected.
**Weekly State Influenza Activity Reporting**

Below is the state influenza activity level reported to the Centers for Disease Control and Prevention each week since the 2013-14 influenza season. **Florida reported sporadic influenza activity for week 20.**

![Influenza Activity Chart](chart.png)

Influenza activity in Florida can vary widely from season to season. This unpredictability underscores the importance of influenza surveillance in Florida.

**Influenza surveillance goals:**
- Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual national vaccine composition and to prepare for potential epidemics or pandemics.
- Surveillance is also conducted to identify unusually severe presentations of influenza infection, detect outbreaks, and determine seasonal influenza trends in order to guide influenza prevention, particularly in high-risk populations like children, adults 65 years old, and pregnant women. These activities are particularly important at the start of flu season in order to identify potential changes in circulating influenza strains.

Note: Surveillance case definitions for influenza-like illness vary across surveillance systems. For more information on influenza surveillance systems and associated case definitions used in Florida, see page 17.

**Statewide ILI Visits**

**ED and UCC Visits for I LI by Flu Season**

*ED = emergency department, UCC = urgent care center, I LI = Influenza-like illness*

![Influenza Activity Chart](chart.png)

**Figure 1** shows the percent of visits for I LI from ED and UCC chief complaint data for ESSENCE-FL participating facilities (n=323), week 40, 2014 to week 20, 2018.

In week 20, the percent of visits to EDs and UCCs decreased statewide. Levels were similar to those observed during previous seasons at this time.

Data indicate influenza activity this season peaked during week 5 (ending February 3, 2018).

The ESSENCE-FL I LI syndrome is composed of chief complaints that include the words “influenza” or “flu,” or chief complaints that include the words “fever” and “cough,” or “fever” and “sore throat.” For more information on ESSENCE-FL, see page 17.
**Visits for ILI to Outpatient Providers by Flu Season**

ILI = influenza-like illness

Figure 2 shows the percent of visits for ILI reported by ILINet outpatient providers statewide (n=44), week 40, 2014 to week 20, 2018. For ILINet, ILI is defined as a fever ≥100°F AND sore throat and/or cough in the absence of another known cause.

In week 20, the percent of visits for ILI reported by ILINet outpatient providers decreased and was similar to levels observed in previous seasons at this time.

**P&I Deaths* from Vital Statistics by Flu Season**

P&I = pneumonia and influenza

Figure 3 shows P&I deaths* for all Florida counties from the Bureau of Vital Statistics, as reported into ESSENCE-FL, week 40, 2014 to week 19, 2018.

In week 19 (ending May 12, 2018), 183 P&I deaths were reported.

The preliminary number of P&I deaths increased, but remained below levels observed during previous seasons at this time for the fourth week in a row.

**P&I Deaths* Multi-Year Regression Model**

P&I = pneumonia and influenza

Figure 4 shows the number of preliminary estimated P&I deaths* for all Florida counties, the number of deaths predicted using a multi-year regression model, and the upper bound of the 95% confidence interval for this prediction.

For week 19 (ending May 12, 2018), 183 preliminary estimated P&I deaths were reported.

The upper bound of the 95% confidence interval for prediction is 237 deaths, with no excess deaths.

* Current season P&I death counts are preliminary estimates and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are considered to be complete through week 19, 2018.
County Influenza and ILI Activity Maps

As of 9:30 a.m. May 23, 2018, a total of 67 counties (100%) reported their weekly level of influenza activity. Please note that data reported after the deadline (Tuesday at 5 p.m.) are recorded but may not be included in the activity maps for this week.

The figures below reflect a county health department’s assessment of influenza activity within their county. For week 20, one county reported increasing activity, 27 counties reported activity at a plateau, and 39 counties reported decreasing activity.

As of 9:30 a.m. May 23, 2018, a total of 67 counties (100%) reported their weekly level of influenza activity. Please note that data reported after the deadline (Tuesday at 5 p.m.) are recorded but may not be included in the activity maps for this week.

County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity.

**Figure 5** shows the results of the influenza activity assessment for week 20, 2018.

---

**County Influenza Activity**

**Map 1** County Influenza Activity Level for Week 20
Reported by 9:30 a.m. May 23, 2018

**Map 2** County Influenza Activity Trend for Week 20
Reported by 9:30 a.m. May 23, 2018

**County ILI Activity by Setting Type**

ILI = influenza-like illness

County health departments are asked to evaluate influenza activity in certain settings within their county. The assessment scale for activity ranges from no or minimal activity to very high activity.

**Figure 5** shows the results of the influenza activity assessment for week 20, 2018.
Map 3 shows influenza and ILI outbreaks by county for week 40, 2017 through week 20, 2018, as reported into Merlin.

**Total Outbreaks:**
- In week 20, two outbreaks were reported: one with laboratory evidence of influenza and one ILI.
  - Influenza and ILI outbreaks were reported in two counties, both located in the southern part of the state (see map 3). Both of these outbreak investigations are closed.
  - A total of 507 outbreaks have been reported this season; this number may increase as sporadic outbreak reports are expected during the summer months. Of those, 465 (92%) have been in facilities serving people at higher risk for complications due to influenza infection (children and adults aged ≥65 years).
  - More outbreaks have been reported this season than in previous seasons on record. An average of 91 total outbreaks were reported during the last five seasons.

**Settings:**
- In week 20, outbreaks occurred in the following settings: one in an assisted living facility and one in a school/camp.
- In the 2017-18 season, outbreaks occurred in the following settings: 64 (12%) in assisted living facilities, 86 (17%) in nursing facilities, 98 (19%) in other long-term care facilities, 2 (0.4%) in adult daycares, 85 (17%) in child daycares, 132 (26%) in schools/camps, 18 (4%) in correctional facilities/juvenile detention centers, 6 (1%) in hospitals, 2 (0.4%) in shelters, and 14 (3%) in other settings (figure 6).

**Laboratory Testing:**
- Neither of the two outbreaks reported in week 20 had specimens collected and submitted to the Bureau of Public Health Laboratories.

**Control Measures:**
- Outbreak control measures were not reviewed with facility leadership for one of the two outbreaks reported by county health departments (CHDs) in week 20. Information regarding control measures is not yet available for the other outbreak.
  - Antiviral treatment for ill individuals was not recommended by CHDs for either of these outbreaks.
  - Antiviral chemoprophylaxis for at-risk individuals was not recommended by the CHDs for either of these outbreaks.

**Hospitalizations and Deaths:**
- Of the two outbreaks reported in week 20, one reported hospitalizations. No deaths have been reported in these two outbreaks.
- Of the 507 outbreaks reported so far this season, people were hospitalized in 131 outbreaks (26%) and deaths were reported in 25 outbreaks (5%).

For detailed information on select outbreaks reported during week 20, see page 16. For updates on select outbreaks reported in week 19 (ending May 12, 2018), see page 16.

For information on outbreaks reported in settings serving children, see page 9. For information on outbreaks reported in settings serving adults aged ≥65 years, see page 11.

Figure 6 shows the distribution of outbreaks by facility as reported in Merlin, week 40, 2017-week 20, 2018 by facility type.

In week 20, two outbreaks were reported: one with laboratory confirmation of influenza and one ILI.
While the most common influenza subtype detected at BPHL statewide for the 2017-18 influenza season has been influenza A (H3), in recent weeks, the percentage of specimens testing positive for influenza A viruses declined. The majority of influenza B viruses identified at BPHL thus far were Yamagata lineage, which is consistent with the national trend. A recent increase in influenza B activity has also been observed nationally. This late-season circulation of influenza B is expected.

Seasons in which A (H3) viruses predominate are associated with more severe illness in young children and adults ≥65 years old. While statewide data indicate influenza A (H3) is the predominantly circulating strain this season, these data also indicate a substantial amount of influenza B Yamagata lineage and influenza A 2009 (H1N1) viruses present and co-circulating.

**Figure 7** shows the number of influenza-positive specimens tested by subtype and lab event date.*

Table 1: Bureau of Public Health Laboratories (BPHL) Viral Surveillance by Lab Event Date*
**Reported by 10:00 a.m. May 23, 2018**

*“Lab event date” is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

For county health departments seeking county-specific laboratory data, please refer to the Flu Lab Report in Merlin. For instructions on how to use the Flu Lab Report, please see the Guide to Flu Lab Report on the Bureau of Epidemiology website:
Regional ILI Visits

Figures 8-14 show the percent of visits for ILI from ED and UCC chief complaints for ESSENCE-FL participating facilities (n=323), by ESSENCE-FL Regional Domestic Security Task Force regions (see map 4) from week 40, 2014 to week 20, 2018.* In week 20, the percent of ED and UCC visits for ILI increased slightly in regions 1 and 6, remained the same in region 5, and decreased in all other regions. Levels were similar to those observed in previous seasons at this time in all regions.

ED and UCC Visits for ILI by Region
ED = emergency department, UCC = urgent care center, ILI = influenza-like illness

Map 4
Emergency Departments (EDs) and Urgent Care Centers (UCCs) Reporting Data to ESSENCE-FL by Regional Domestic Security Task Force Region, May 23, 2018 (n=323)
Figure 16 shows the number of visits for ILI reported by ILINet outpatient providers statewide (n=44) by age group, week 40, 2014 to week 20, 2018.

In week 20, the number of visits for ILI increased slightly in the 0-4 age group and decreased in all other age groups. In all age groups, levels were similar to those observed during previous seasons at this time.

*Data presented here are counts, not proportions. This is because age group denominator data is not available through ILINet.

Figure 17 shows P&I deaths* for all Florida counties by age group, as reported into ESSENCE-FL, week 40, 2014 to week 19, 2018.

In week 19 (ending May 12, 2018), the preliminary number of P&I deaths increased in the ≥65 age group and decreased or remained the same in all other age groups. In all age groups, levels were similar to or below those observed during previous seasons at this time.

*Current season P&I death numbers are preliminary estimates and may change as more data are received. The most recent data available are displayed here. Vital statistics death records received in ESSENCE-FL are currently considered to be complete through week 19, 2018.
Background: Children, especially those with underlying health conditions, are at higher risk for severe complications from influenza infection. The single best way to protect children from influenza is to get them vaccinated every year. The Centers for Disease Control and Prevention recommends vaccination as long as influenza viruses are circulating. To find a flu shot near you, please visit: www.floridahealth.gov/findaflushot.

ED and UCC Visits for ILI by Children ≤18 Years Old

ED = emergency department, UCC = urgent care center, ILI = influenza-like illness

Figure 18 shows the percent of ILI visits among all ED and UCC visits for children ≤18 years old, as reported into ESSENCE-FL, week 40, 2014 to week 20, 2018. In week 20, the percent of ILI visits among all ED and UCC visits for children ≤18 years old decreased and remained similar to levels observed during previous seasons at this time.

Outbreaks in Facilities Serving Children

ILI = influenza-like illness

Total outbreaks in facilities serving children:

- In week 20, two total outbreaks were reported. One of the two outbreaks was reported in a facility serving children (schools/camps or child daycares). This outbreak does not have laboratory confirmation of influenza.
  - This outbreak were reported in the southern part of the state and its investigation is closed.

Settings:

- This outbreak was reported in a school/camp.

Laboratory testing:

- No specimens were available for testing at the Bureau of Public Health Laboratories for this outbreak.

Control measures:

- Control measures were not discussed with facility leadership for this outbreak.

Hospitalizations and deaths:

- No hospitalizations or deaths were reported for this outbreak.

Figure 19 shows the distribution of each outbreak etiology reported in facilities serving children (schools/camps and child daycares) as reported into Merlin, week 40, 2017 through week 20, 2018. Outbreaks with multiple etiologies are displayed more than once.

Figure 20 shows the number of outbreaks reported in facilities serving children (schools/camps and child daycares) by single, multiple or unknown etiology as reported into Merlin, week 40, 2017 through week 20, 2018.
At-Risk Populations: Children

Influenza-Associated Pediatric Deaths

Figures 21-23 show the number of pediatric deaths associated with influenza infection, week 40, 2013 to week 20, 2018.

In week 20, no new influenza-associated pediatric deaths were confirmed. A total of eight influenza-associated pediatric deaths have been confirmed as of week 20. All of the deaths confirmed so far this season have been in unvaccinated children.

While rare, Florida receives reports of influenza-associated pediatric deaths each season. Most deaths occur in unvaccinated children with underlying health conditions. Children, especially those with underlying health conditions, are at higher risk of severe outcomes from influenza infection.

A recent study showed that flu vaccination can reduce a child’s likelihood of dying from influenza by 50-60%. For more information, visit: https://www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.

At-Risk Populations: Pregnant Women

ESSENCE-FL collects data daily from 323 EDs and UCCs. Data are processed into 11 different syndrome categories based on the patient’s chief complaint. One of the categories is ILI, which is composed of chief complaints that include the words “influenza” or “flu,” or complaints that contain “fever” and “cough,” or “fever” and “sore throat.” The Florida Department of Health uses ED and UCC chief complaint data to monitor influenza and ILI activity in a timely manner in groups at higher risk of severe health outcomes (such as hospitalization and death) from influenza infection. These at-risk groups include pregnant women, children ≤18 years old, and adults ≥65 years old.

ED and UCC Visits for ILI by Pregnant Women

Pregnant women and their babies are at higher risk for severe complications due to influenza infection.

Figure 24 shows the number of visits* to EDs and UCCs with chief complaints of influenza infection and pregnancy, as reported into ESSENCE-FL, week 40, 2014 to week 20, 2018.

In week 20, the number of visits to EDs and UCCs by pregnant women with mention of influenza decreased and was similar to levels observed during previous seasons at this time.

*This count under-represents the true number of pregnant women presenting for care to EDs and UCCs with influenza. The overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.
At-Risk Populations: Adults ≥65 Years Old

**Background:** Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. Annual vaccination is the best way to prevent influenza infection. The Centers for Disease Control and Prevention recommends vaccination as long as influenza viruses are circulating. To locate a flu shot near you, please visit: [www.floridahealth.gov/findaflushot](http://www.floridahealth.gov/findaflushot).

**ED and UCC Visits for ILI by Adults ≥65 Years Old**

*Figure 25* shows the percent of ILI visits among all ED and UCC visits for adults ≥65 years old, as reported into ESSSENCE-FL, week 40, 2014 to week 20, 2018.

In week 20, the percent of ILI visits among all ED and UCC visits for adults ≥65 years decreased and was similar to levels observed in previous seasons at this time.

**Outbreaks in Facilities Serving Adults ≥65 Years Old**

ILI = influenza-like illness

*Figure 26* shows the number of outbreaks with **antiviral treatment** administered to ill individuals by week in facilities serving adults ≥65 years old (nursing homes, assisted living facilities, and other long-term care facilities).

*Figure 27* shows the number of outbreaks with **antiviral chemoprophylaxis** administered to at-risk individuals by week in facilities serving adults ≥65 years old.

**Total outbreaks in facilities serving adults ≥65 years old:**

- In week 20, a total of two outbreaks were reported. One of these two outbreaks were reported in a facility serving adults aged ≥65 years old. This outbreak has laboratory evidence of influenza (for more information, see page 16).
  - This outbreak was reported in the southern part of the state and its investigation is closed.

**Settings:**

- In week 20, one outbreak was reported in an assisted living facility.

**Laboratory testing:**

- No specimens were available for testing at the Bureau of Public Health Laboratories for this outbreak. Laboratory testing was conducted at an outside laboratory for this outbreak.

**Control measures:**

- Information regarding outbreak control measures being reviewed with facility leadership is not yet available for this outbreak.
  - Antiviral treatment for ill individuals was not recommended by the county health department (CHD) for this outbreak.
  - Antiviral chemoprophylaxis for at-risk individuals was not recommended by the CHD for this outbreak.

**Hospitalizations and deaths:**

- Three hospitalizations and no deaths were reported during this outbreak.
Respiratory syncytial virus (RSV) activity:
• In week 20, the percent of children <5 years old diagnosed with RSV at emergency departments and urgent care centers increased and remained above levels observed during previous seasons at this time.
• Florida’s southeast region is currently in RSV season.
• No new RSV-associated pediatric deaths were identified in week 20. One RSV-associated pediatric death has been identified so far this year. Premature infants and children <2 years with underlying medical conditions are at higher risk for severe complications from RSV infection. Prophylaxis is available for children who qualify. For more information, contact your physician.
• To learn more about RSV in Florida, please visit: www.floridahealth.gov/rsv.

RSV seasonality:
• RSV activity in Florida typically peaks in November through January, though activity can vary dramatically by region. According to CDC, the start of RSV season is marked by the first two consecutive weeks during which the average percentage of specimens testing positive for RSV is ≥10%.
• Florida has established regular RSV seasons based on these thresholds. Despite circulation at lower levels in different regions at different times of year, RSV is detected in all regions throughout the year.
• Florida’s RSV season is longer than the rest of the nation and has distinct regional seasonality. For more information on RSV seasonality in Florida, see the American Academy of Pediatrics’ (AAP) 2015 Red Book.

RSV surveillance goals:
• A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants. The determination of unique seasonal and geographic trends of RSV activity has important implications for prescribing patterns for initiating prophylaxis to children at high risk for RSV infection. The AAP currently recommends that preapproval for prophylactic treatment be made based on state surveillance data.
• See the back page of this report for more information on RSV surveillance systems used in Florida: page 17.

ED and UCC Visits for RSV by Children <5 Years Old
ED = emergency department, UCC = urgent care center, RSV = respiratory syncytial virus

Figure 28 shows the percent of visits to EDs and UCCs with discharge diagnoses that include RSV or RSV-associated illness, as reported by participating ESSENCE-FL facilities (n=323), week 30, 2014 to week 20, 2018.

In week 20, the percent of children presenting to participating EDs and UCCs for care with RSV increased and remained above levels observed during previous seasons at this time.

Laboratory RSV Surveillance
RSV = respiratory syncytial virus

Figure 29 shows the percent of specimens testing positive for RSV, as reported by hospital laboratories (n=10), week 30, 2014 to week 20, 2018.

In week 20, the percent of specimens testing positive for RSV decreased.

*This overall trend has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.
Other Respiratory Virus Surveillance

Statewide activity:

- In week 20, the percent of specimens testing positive for rhinovirus decreased, but remained higher than all other respiratory viruses under surveillance.

Enterovirus D68 (EV-D68) activity:

- In week 20, no new people tested positive for EV-D68 in Florida.
  - No people have tested positive for EV-D68 by PCR so far in 2018. In 2017, three people tested positive for EV-D68 by PCR in Florida. One person was identified in August 2017 during the investigation of an ILI outbreak. Two people were identified in October 2017 as part of routine outpatient surveillance as a result of Florida participating in the Acute Respiratory Infection Epidemiology and Surveillance (ARIES) Program.
  - To learn more about EV-D68, please visit: http://www.floridahealth.gov/diseases-and-conditions/d68.

Outbreaks:

- In week 20, one outbreak of influenza B and parainfluenza unspecified was reported. No outbreaks of respiratory syncytial virus (RSV), adenovirus, human metapneumovirus (MPV), or rhinovirus were reported in week 20.

Laboratory Viral Respiratory Surveillance

Figure 30 shows the percent of laboratory results testing positive for eight common respiratory viruses, as reported by hospital laboratories (n=10), week 40, 2014 to week 20, 2018.

In week 20, the percent of specimens testing positive for rhinovirus decreased, but remained higher than all other respiratory viruses under surveillance.

Non-Influenza ARIES Laboratory Outpatient Surveillance*

ARIES = Acute Respiratory Infection Epidemiology and Surveillance Program
BPHL = Bureau of Public Health Laboratories

Figure 31 shows the number of specimens testing positive for 12 common respiratory viruses, as reported by BPHL and ARIES outpatient providers statewide (n=6), week 40, 2016 to week 19, 2018.

In week 19 (ending May 12, 2018), none of the specimens submitted by ARIES providers to BPHL tested positive by extended respiratory panel testing.

*Data presented here are counts, not proportions. The most recent data available are displayed here. ARIES laboratory data are currently considered to be complete through week 19, 2018. Laboratory results for specimens that have not yet been tested in full will be included in future reports.

• 2 outbreaks of rhinovirus  
• 1 outbreak of adenosivirus  
• 135 outbreaks of unknown etiology |
In week 20, two outbreaks were reported in Merlin: one with laboratory confirmation of influenza and one ILI. One select outbreak is summarized below.

Lee County

- An assisted living facility reported 17 residents and one staff member with ILI. Three individuals sought treatment at local emergency departments and three individuals were hospitalized. None of the ill individuals died. Seven specimens were collected from ill individuals for testing at an outside laboratory. Of the seven specimens that were tested, five specimens tested positive for parainfluenza unspecified (test type unknown) and one specimen tested positive for influenza B unspecified (test type unknown). No specimens were available for testing at BPHL. Influenza vaccination status for the 2017-18 season for residents and staff is currently unknown. Information regarding control measures is not yet available. This investigation is closed.

In week 19 (ending May 12, 2018), three outbreaks were reported into Merlin. None of these outbreaks were selected for summarization.
Florida ILINet - Data source for figures 2 and 16
- ILINet is a nationwide surveillance system composed of sentinel providers, predominately outpatient health care providers. Florida has 118 sentinel providers enrolled in ILINet who submit weekly influenza-like illness (ILI) and total visit counts, as well as submit ILI specimens to the Bureau of Public Health Laboratories (BPHL) for confirmatory testing.

ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal - Data source for figures 1, 3-4, 8-15, 17-18, 24-25, 28; map 4
- Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in ILI visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=323) electronically transmit visit data into ESSENCE-FL daily or hourly.

Outbreak Reporting in Merlin - Data source for figures 6, 19-20, 26-27, map 3, and tables 2 and 3
- Merlin tracks influenza and ILI outbreak investigations by CHDs. Reports by CHDs include the type of respiratory disease causing the outbreak and settings where outbreaks are occurring. CHD epidemiologists report outbreaks of influenza or ILI into Merlin, Florida’s reportable disease surveillance system.

Bureau of Public Health Laboratories (BPHL) - Data source for figure 7 and table 1
- BPHL performs confirmatory testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners.

Laboratory Viral Respiratory Surveillance - Data sources for figures 29-30
- The National Respiratory and Enteric Virus Surveillance System (NREVSS) and Electronic Laboratory Reporting (ELR) collect data from laboratories in Florida on a weekly basis and monitor temporal and geographic patterns of eight commonly circulating respiratory viruses. NREVSS data is collected by the Centers for Disease Control and Prevention (CDC) and ELR data is collected by the Florida Department of Health (DOH).

Acute Respiratory Infection Epidemiology and Surveillance (ARIES) Program - Data source for figure 31
- Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) is a nationwide surveillance system composed of nine participating jurisdictions. Florida has seven sentinel providers enrolled in ARIES who submit weekly ILI counts, as well as submit ILI specimens to BPHL for testing.

Case-Based Influenza Surveillance
- Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child’s death is reportable in Florida. Influenza-associated pediatric deaths are documented by CHDs in Merlin.
- In addition, an individual of any age infected with novel or pandemic influenza strain(s) is reportable in Florida. Pandemic strain influenza cases are documented by CHDs in Merlin.
- For more information about reportable diseases, please visit www.Floridahealth.gov/diseasereporting.
