Week 5 influenza & influenza-like illness (ILI) activity summary:

Activity increased in week 5 and reached the highest level observed so far this season. Notable increases were observed in all regions of the state. Elevated activity is still expected for several more weeks.

Thirty-five outbreaks were reported, up from 11 outbreaks in the previous week. Of the 35 outbreaks reported, 19 were influenza-associated and 16 were ILI.

Two new influenza-associated pediatric deaths were reported. One child was not vaccinated for the 2019-20 season, and the other was too young to be vaccinated. Seven influenza-associated pediatric deaths have been reported so far this season, all in unvaccinated children.

Influenza A 2009 (H1N1) remained the predominant strain. Earlier in the season, influenza B Victoria lineage viruses were predominant. Influenza B Victoria lineage viruses continue to circulate at lower levels.

The Centers for Disease Control and Prevention (CDC) continues to recommend that people who have not yet been vaccinated do so as soon as possible. Vaccination should continue as long as influenza viruses are circulating. It is especially important for people at higher risk for complications (children, adults ≥65 years, pregnant women, and people with underlying medical conditions).

On January 10, 2020, CDC issued a health advisory reminding clinicians that influenza B viruses can cause severe illness in people of all ages and reiterating vaccination and antiviral treatment recommendations (emergency.cdc.gov/han/HAN00425.asp).

In addition to getting vaccinated, the Florida Department of Health recommends you take everyday precautions to prevent the spread of influenza and other respiratory viruses:

- Wash your hands often with soap and water (if soap is not available, use an alcohol-based sanitizer).
- Avoid touching your eyes, nose, and mouth.
- If you do get sick, stay home until fever-free for at least 24 hours (without the use of fever-reducing medication).

Florida ILI Surveillance System Summary ............... 16

Background

Influenza, or flu, is a respiratory infection caused by a variety of influenza viruses. Most experts believe influenza viruses spread primarily by droplets made when infected people cough, sneeze, or talk. Less often, a person might become infected with influenza by touching a surface or object contaminated with influenza virus and then touching their own mouth, eyes, or nose.

The best way to prevent influenza infection is to get vaccinated each year. Influenza vaccines protect against the three or four influenza viruses research suggests will be most common.

Influenza Surveillance

Individual cases of influenza are not reportable in Florida with the exception of novel influenza A (a new subtype of influenza A) and influenza-associated pediatric deaths. All outbreaks, including those due to influenza or influenza-like illness (ILI), are reportable in Florida.

Influenza surveillance is conducted to detect changes in the influenza virus. These data are used to help determine the annual northern hemisphere vaccine composition and to prepare for potential pandemics.

Surveillance is also conducted to identify any unusually severe presentations of influenza, detect outbreaks, and determine the onset, peak, and wane of the influenza season to assist with influenza prevention, particularly in high-risk populations like the very young, adults aged ≥65 years, and pregnant women.

The influenza reporting year is defined by standard reporting weeks outlined by the Centers for Disease Control and Prevention, where every year has 52 or 53 reporting weeks. Increased surveillance for influenza in Florida for the 2019-20 season began in week 40 (starting on September 29, 2019) and will extend through week 20 (ending May 16, 2020). This report is produced by the Florida Department of Health on a weekly basis during the regular influenza season and an abbreviated report is published on a biweekly basis during the summer months.

Surveillance case definitions for ILI vary slightly across surveillance systems. For more information on Florida’s influenza surveillance systems and associated case definitions, see page 16.

Statewide Activity

Figure 1: In week 5, the percent of emergency department and urgent care center visits for ILI statewide increased and reached the highest level observed so far this season. Activity in week 5 was above peak levels observed during the 2018-19 and 2016-17 seasons.

![Graph showing the percent of visits for ILI](image)

Figure 1 shows the percent of visits for ILI for facilities participating in ESSENCE-FL (n=368) statewide for the current season (week 40, 2019 to week 5, 2020) and the last three seasons (2018-19, 2017-18, and 2016-17). The ESSENCE-FL ILI syndrome captures visits with chief complaints that include the words “influenza” or “flu,” or chief complaints that include the words “fever” and “cough,” or “fever” and “sore throat.” For more information on the use of ESSENCE-FL for influenza and ILI surveillance, see page 16.
Figure 2: In week 5, Florida reported **widespread geographic spread of influenza** to the Centers for Disease Control and Prevention.

![Diagram](image)

**Regional**: outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

**Widespread**: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

Figure 3: In week 5, **the percent of patients with ILI reported by ILINet providers statewide increased** and was above peak levels observed during the 2018-19 and 2016-17 seasons. Of note, the number of reporting providers remained low in recent weeks.

![Diagram](image)

For ILINet, ILI is defined as a fever ≥100°F in conjunction with sore throat or cough in the absence of another known cause.

Figure 4: In week 4 (ending 1/25/20), **the number of pneumonia and influenza deaths identified statewide decreased** and was below levels observed at this time in previous seasons.

![Diagram](image)

*Recent P&I death counts are preliminary numbers that may change as more data are received. The most recent data available are displayed here.*
Figure 5: Most counties reported **mild activity** for week 5. Nineteen counties reported **moderate activity**, and one county reported **elevated activity**.

Figure 6: Most counties reported **increasing activity** in week 5. Seventeen counties reported **activity at a plateau**, and four counties reported **decreasing activity**.

▲ **Figures 5-6** show **county influenza activity data** as reported by county health departments in EpiGateway. These data are collected on a weekly basis and are used to determine influenza activity levels for each county (Figure 5). County health departments also report their weekly influenza activity trend (Figure 6).

Figure 7: In week 5, the **percent of specimens testing positive for influenza** increased and remained higher than other respiratory viruses under surveillance.

▲ **Figure 7** shows the **percent of laboratory results testing positive for eight common respiratory viruses**, as reported by laboratories participating in the National Respiratory and Enteric Virus Surveillance System (NREVSS) and laboratories reporting validated respiratory virus data to the Florida Department of Health via electronic laboratory reporting (n=7), week 40, 2019 to week 5, 2020.
Influenza and ILI Outbreaks

Week 5 Outbreaks at a Glance:

Number Reported: 35 Outbreaks
Influenza-Associated: 19 Outbreaks
Severe Outcomes*: 5 Outbreaks

Outbreak Summary:

In week 5, 19 influenza-associated and 16 ILI outbreaks were reported, a notable increase from the previous week. Severe outcomes* were reported in five of 35 outbreaks. One or more hospitalizations were reported in each of these five outbreaks. No deaths were reported.

During the previous season, severe outcomes were most commonly reported in facilities serving adults aged ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities). In week 5, four of the five outbreaks with severe outcomes were in facilities serving adults aged ≥65 years.

Figure 8 shows reported influenza or ILI outbreaks by county. Counties with outbreaks reported in week 5 are outlined in bold.

Figure 9: In week 5, eight outbreaks were reported in facilities serving adults aged ≥65 years, 15 outbreaks were reported in facilities serving children, and 12 outbreaks were reported in other facilities.

Figure 10: As of week 5, 57.6% of outbreaks reported so far this season were influenza-associated.

Figure 9 shows the number of influenza-associated or ILI outbreaks by week as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020. More information on how these setting categories are defined is available on pages 6-7.

Figure 10 shows the total number of outbreaks and the number of influenza-associated outbreaks as reported in Merlin by county health departments for the 2019-20 season as of week 5, 2020. For more information on how ILI and influenza-associated outbreaks are defined, see page 16.

*Severe outcomes are defined as hospitalization or death among one or more outbreak cases.

**Total outbreaks includes the number of influenza-associated outbreaks in addition to outbreaks of ILI.
Summary of Outbreaks in Facilities Serving Children:
In week 5, 15 new outbreaks of influenza or ILI were reported in facilities serving children.
*Facilities serving children include primary schools, secondary schools, and child daycares.

Figure 11: In week 5, four influenza-associated outbreaks and 11 ILI outbreaks were reported in facilities serving children.

Summary of Outbreaks in Facilities Serving Adults ≥65 years:
In week 5, eight new outbreaks of influenza or ILI were reported in facilities serving adults aged ≥65 years.
**Facilities serving adults ≥65 years include assisted living facilities, nursing homes, and other long-term care facilities.

Figure 12: In week 5, seven influenza-associated outbreaks and one ILI outbreak were reported in facilities serving adults ≥65 years.
Summary of Outbreaks in Other Facilities:

In week 5, 12 new outbreaks of influenza or ILI were reported in other facilities.

*Other facilities include post-secondary schools, adult daycares, correctional facilities, hospitals, shelters, and workplaces.

Figure 13: In week 5, eight influenza-associated outbreaks and four ILI outbreaks were reported in other facilities.

Figure 13 shows the number of influenza-associated or ILI outbreaks in other facilities by week as reported in Merlin by county health departments, week 40, 2019 to week 5, 2020.

Figure 14: Influenza A 2009 (H1N1) continues to be the most common influenza virus identified at BPHL in recent weeks, and influenza A 2009 (H1N1) is the most common influenza subtype detected so far this season. Influenza B Victoria lineage was predominant earlier in the season, but the frequency of those detections decreased in recent weeks.

**Influenza Surveillance**

Figure 14 shows the number of influenza-positive laboratory results at the Bureau of Public Health Laboratories (BPHL) by lab-event date,* week 30, 2019 through week 5, 2020.

Figure 15: Influenza A 2009 (H1N1) makes up the largest number of influenza detections at BPHL since week 40. Earlier in the season, influenza B Victoria lineage was the most common strain.

**Influenza Surveillance**

Figure 15 shows the number of influenza-positive laboratory results for specimens submitted to BPHL for the current 2019-20 influenza season, week 40, 2019 through week 5, 2020.

The results shown here are reflective of the influenza testing performed by BPHL thus far for specimens with lab event dates* within this timeframe.

**Lab event date** is defined as the earliest of the following dates associated with influenza testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted.

**This number includes both influenza A specimens for which subtyping has not yet been performed as well as specimens that tested positive for influenza A but were unable to be subtyped due to low viral load.
Figures 16-22 show the percent of emergency department and urgent care center visits for influenza-like illness (ILI) at ESSENCE-FL participating facilities (n=368) from week 40, 2016 to week 5, 2020. Data are organized by region (see Figure 23).

Figure 16: In **region 1**, **ILI activity increased** during week 5 and was similar to peak levels observed during the 2018-19 season.

Figure 17: In **region 2**, **ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

Figure 18: In **region 3**, **ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

Figure 19: In **region 4**, **ILI activity increased** during week 5 and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.

Figure 20: In **region 5**, **ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

Figure 21: In **region 6**, **ILI activity increased** during week 5 and was above peak activity observed during the 2018-19 and 2016-17 seasons.

Figure 22: In **region 7**, **ILI activity increased** during week 5 and was similar to peak activity observed during the 2018-19 season.

Figure 23 shows emergency departments and urgent care centers reporting data to ESSENCE-FL (n=368) with regions outlined in bold.
Background: At-Risk Populations, Children

Children, especially those with underlying health conditions (like asthma or diabetes), are at higher risk for severe complications from influenza infection. **The single best way to protect children from influenza is to get them vaccinated every year.** The Centers for Disease Control and Prevention continues to recommend influenza vaccination as long as flu viruses are circulating. To find a flu shot near you, please visit: VaccineFinder.org.

Figure 24: In week 5, the percent of emergency department and urgent care center visits for ILI in children <18 years increased and was above peak activity observed during the 2018-19 and 2016-17 seasons.

Figures 25-26: In week 5, **two new influenza-associated pediatric deaths were reported**, one in an unvaccinated child and one in a child who was too young to be vaccinated. A total of seven influenza-associated pediatric deaths have been reported so far this season.

In week 4, **two new influenza-associated pediatric deaths were reported**. One death was associated with influenza A unspecified in a child with no known underlying medical conditions. The other death was associated with influenza B unspecified in a child with an underlying medical condition. Neither child was vaccinated for the 2019-20 season.

A total of seven influenza-associated pediatric deaths have been reported so far this season. **Influenza vaccination is recommended as long as influenza viruses are circulating, even in February or later.**

Children, especially those with certain health conditions are at increased risk of severe complications from influenza infection. **Influenza vaccination has been shown to reduce a child’s likelihood of dying from influenza by up to 60%**. For more information, please visit: www.cdc.gov/media/releases/2017/p0403-flu-vaccine.html.
At-Risk Populations Continued

Background: At-Risk Populations, Pregnant Women

Influenza is five times more likely to cause severe illness in pregnant women (even those who are generally healthy) compared to women who are not pregnant. Pregnant women with certain underlying medical conditions (such as asthma or heart disease) are at even greater risk for severe complications from influenza. **Inactivated influenza vaccines are safe, provide the best protection for pregnant women and their babies, and are recommended at any time during pregnancy.** Vaccination during pregnancy provides maternal antibody protection to infants too young to be vaccinated for influenza and has been shown to protect pregnant women from influenza-associated hospitalization and preterm birth. For more information, talk to your health care provider.

Figure 27: In week 5, the **number of emergency department and urgent care center visits for influenza among pregnant women decreased** and was within levels observed at this time in past seasons.

*This count underrepresents the true number of pregnant women presenting for care to emergency departments and urgent care centers with influenza, however, the overall trend has been validated through review of discharge data collected by the Agency of Health Care Administration.

Background: At-Risk Populations, Adults Aged ≥65 Years

Adults ≥65 years old are at higher risk for severe complications from influenza infection, including hospitalization and death. While influenza seasons vary in intensity, adults in this age group bear the greatest burden of severe influenza disease. In Florida, an average of 80% of seasonal pneumonia and influenza deaths occurred in adults aged ≥65 years over the last five influenza seasons. **Annual vaccination is the best way to prevent influenza infection.**

Figure 28: In week 5, the **percent of emergency department and urgent care center visits for ILI in adults ≥65 years increased** and was above peak activity levels observed during the 2018-19 and 2016-17 seasons.
Respiratory Syncytial Virus Surveillance

Background

Respiratory syncytial virus (RSV) is a common respiratory virus that usually causes mild, cold-like symptoms. Young children and older adults, especially those with certain underlying health conditions, are at higher risk for severe illness from RSV. Prophylaxis is available for children who qualify. For more information, contact your health care provider.

RSV Surveillance

A statewide RSV surveillance system was implemented in Florida to support clinical decision-making for prophylaxis of premature infants. The determination of unique seasonal and geographic trends of RSV activity in Florida has important implications for prescribing patterns for initiating prophylaxis to children at high risk for complications from RSV infection. The American Academy of Pediatrics currently recommends pre-approval for prophylactic treatment be made based on state surveillance data. For more information on RSV surveillance systems used in Florida, see the last page of this report.

Florida’s RSV season is longer than the rest of the nation and has distinct regional patterns. The Florida Department of Health established regional RSV seasons based on activity thresholds provided by the Centers for Disease Control and Prevention (see Figure 29). Currently, all of Florida’s regions are in RSV season.

To learn more about RSV in Florida, please visit: FloridaHealth.gov/RSV.

Week 5 (January 26-February 1, 2020) Activity Summary

In week 5, RSV activity in children <5 years decreased and was similar to levels observed at this time in 2019.

No new RSV-associated outbreaks were reported. A total of eight RSV-associated outbreaks have been reported since week 30, 2019 (beginning on July 27, 2019).

Figure 30: In week 5, the percent of emergency department and urgent care center visits for RSV among children <5 years decreased and was similar to levels observed at this time in 2019.

*The overall trend displayed in Figure 30 has been validated through review of hospital discharge data collected by the Agency for Health Care Administration.
Figure 31: In week 5, the percent of specimens testing positive for RSV increased. Levels were similar to those observed at this time in previous seasons.

Summary of RSV-Associated Outbreaks:
In week 5, no new RSV-associated outbreaks were reported. Since week 30, 2019, eight RSV-associated outbreaks have been reported.

RSV-Associated Outbreaks in Week 4:
0 Outbreaks

Figure 32: In week 5, no new RSV-associated outbreaks were reported. Since week 30, outbreaks have been reported in Florida’s southeast, central, and northwest regions.

Figure 33: In week 5, no new RSV-associated outbreaks were reported. All of the outbreaks reported since week 30 have been reported in facilities serving children.

Figure 33 shows the number of RSV-associated outbreaks by setting and week as reported by county health departments in Merlin, week 30, 2019 to week 5, 2020.
Other Respiratory Virus Surveillance

- Rhinovirus
- Enterovirus unspecified
- Enterovirus D68
- Parainfluenza 1
- Parainfluenza 2
- Parainfluenza 3
- Coronavirus NL63
- Coronavirus HKU1
- Coronavirus OC43
- Coronavirus 229E
- Human metapneumovirus
- Adenovirus
- Group A Streptococcus
- Other

**Figure 34** shows the number of unique times a pathogen was associated with a respiratory outbreak for outbreaks reported from week 30, 2019 to week 5, 2020.

**Figure 35** shows the number of PCR-positive laboratory findings for enterovirus unspecified, enterovirus D68, and rhinovirus by week among specimens submitted to the Bureau of Public Health Laboratories (BPHL) for extended respiratory panel testing.

**Figure 36** shows the number of PCR-positive laboratory findings for parainfluenza 1-3 by week among specimens submitted to BPHL for extended respiratory panel testing.

**Figure 37** shows the number of PCR-positive laboratory findings for seasonal coronaviruses NL63, HKU1, OC43, and 229E by week among specimens submitted to BPHL for extended respiratory panel testing.

**Figure 38** shows the number of PCR-positive laboratory findings for human metapneumovirus and adenovirus by week among specimens submitted to BPHL for extended respiratory panel testing.

*Data shown in figures 34-38 include results for specimens submitted by Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers (n=4) as reported by BPHL.

**Results are organized by week based on "lab event date" (defined as the earliest of the following dates associated with testing at the laboratory: date specimen collected, date received by the laboratory, date reported, or date inserted).

*For the purposes of this report, notable outbreaks are defined as influenza-associated, RSV-associated, or ILI outbreaks with two or more hospitalizations, one or more deaths, or 30 or more cases. For more information on how outbreaks are defined, see page 16.
Summary of Included Surveillance Systems

**ESSENCE-FL Syndromic Surveillance and Vital Statistics Portal** Data source for figures 1, 4, 16-24, 27, 28, 30

Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE-FL) measures trends in influenza-like illness (ILI) visits from emergency departments (ED) and urgent care clinics (UCC) and influenza mortality by using death certificates from the Bureau of Vital Statistics. Participating EDs and UCCs (n=368) electronically transmit visit data into ESSENCE-FL daily or hourly.

For statewide and regional data on ILI, visits are counted as ED or UCC visits to participating facilities that include the words "influenza" or "flu" in patient chief complaints. Chief complaints with the words "fever" and "cough," or "fever" and "sore throat" are also counted as ILI.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities including counties that report RSV-associated illness is included in the discharge diagnosis.

For RSV mortality surveillance, death record literals are queried using a free-text query that searches for references to RSV in death certificates. Any mention of RSV in the death certificate literal is counted as an ILI death. Deaths counts are aggregated and presented by date of death.

For respiratory syncytial virus (RSV) surveillance, visits are counted as ED or UCC visits to participating facilities. As such, outbreak counts are considered preliminary and subject to change. As such, outbreak counts may be decreased as additional information is received.

**Outbreak Reporting in Merlin**

Outbreak investigations are tracked in Merlin (Florida’s reportable disease surveillance system) by investigating county health departments. Outbreak reports include implicated viruses or bacteria, the outbreak setting, and recommendations made to mitigate the spread of disease (among other data elements). All outbreak data are considered preliminary and subject to change. As such, outbreak counts may increase or decrease as additional information is received.

- ILI outbreaks in facilities serving adults ≥65 years (assisted living facilities, nursing facilities, and long-term care facilities) are defined as two or more individuals with ILI (fever and cough or fever and sore throat in the absence of positive laboratory results). ILI outbreaks in facilities serving children (primary/secondary schools and child daycares) are defined as three or more epidemiologically linked individuals with ILI.
- Influenza-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for influenza. Influenza-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for influenza. Testing may be conducted by the Bureau of Public Health Laboratories (BPHL), commercial laboratories, hospitals, or private health care providers.

Continued on next page.
• RSV-associated outbreaks in facilities serving adults aged ≥65 years are defined as two or more individuals with respiratory symptoms, where at least one individual tests positive for RSV. RSV-associated outbreaks in facilities serving children are defined as three or more epidemiologically linked individuals with respiratory symptoms, where at least one individual tests positive for RSV. Testing may be conducted by BPHL, commercial laboratories, hospitals, or private health care providers.
• Notable outbreaks include influenza-associated, RSV-associated, or ILI outbreaks in any setting with 30 or more cases, two or more hospitalized cases, or one or more cases who died.
• Household clusters are not counted as outbreaks.

Bureau of Public Health Laboratories (BPHL) Data source for figures 14, 15, and 35-38.

BPHL performs testing and subtyping on surveillance specimens from sentinel providers, outbreak investigations, patients with severe or unusual influenza presentations, and medical examiners. Sentinel providers include both ILINet and Acute Respiratory Infection Epidemiology and Surveillance Program (ARIES) providers. Some laboratories also routinely submit pre-screened influenza-positive specimens for testing at BPHL for surveillance purposes.

Case-Based Influenza Surveillance Data source for figures 25 and 26

Death in a child whose laboratory-confirmed influenza infection has been identified as a contributing to the child’s death is a reportable condition in Florida. Influenza-associated pediatric deaths are documented by county health departments in Merlin.

In addition, an individual of any age suspected as being infected with non-seasonal or pandemic influenza A is reportable condition in Florida. Such cases are referred to as cases of ‘novel influenza A.’ Novel influenza A cases are documented by county health departments in Merlin.

For more information about reportable diseases and conditions, please visit FloridaHealth.gov/DiseaseReporting.
