## **RED TIDE**

## **RED TIDE FACTS:**

- In Florida, red tide is caused by a naturally occurring microscopic alga (a plant-like microorganism) called Karenia brevis or K. brevis.
- K. brevis produces a toxin that can kill fish and cause respiratory problems in humans. People with chronic respiratory problems should avoid red tide areas.
- Red tide algal blooms can change rapidly, staying in one place for months or just a few days or weeks.
- All seafood from restaurants and hotels is monitored and is safe to eat.
- Red tide symptoms include coughing, sneezing, and watery eyes.
