Review of Meeting Minutes from December 10, 2018 Meeting
Old Business & Research Program News
Old Business

Action items from the RRAC meeting on December 10, 2018

1. Elect a new chair for the committee. Sending an email to all RRAC members and get names of whoever is interested in the chair position
2. Continue with high priority research projects.
3. Update memberships for several RRAC members.
4. Post meeting materials used for December 10 meeting onto DOH’s RRAC web page.
5. Find out to whom the “Letter to home builders regarding OSTDS permitting” was sent to the Florida Home Builder’s Association.
Elect A New Chair

Discussed during the RRAC meeting on December 10, 2018

1. Mr. Bob Himschoot volunteered to be the new chair.
2. Ms. Roxanne Groover also volunteered to be the new chair.
3. Because Mr. Bill Melton (vice chair) was not at the meeting, RRAC decided to decide during the next meeting.
4. Make a decision today.
## Continue with High Priority Research Projects

Membership Update

1. Memberships for the following professional groups have been updated:
   a) Home Building Industry (Florida Home Builders Association)
   b) Professional Engineer (Florida Engineering Society)
   c) Real Estate Profession (Florida Association of Realtors)
Membership Update - Continued

2. Appointment letters have been sent to:
   • Mr. Bob Himschoot (Primary member). **Alternate member vacant.**
   • Dr. Mark Tumeo (Primary member). Mr. Clay Tappan (Alternate member)
   • Mr. Eric Rolling (Primary member). Mr. Thomas Baker (Alternate member)

3. Updated membership list posted at:
Meeting Materials for the December 10, 2018 Meeting Posted:

To whom the “Letter to home builders regarding OSTDS permitting” was sent to the Florida Home Builder’s Association

1. The letter was sent to Mr. Doug Buck, director of Government Affairs for the Florida Home Builders Association.

2. An email was sent to Mr. Bob Himschoot on December 19, 2018 about this finding.
Elect a New Chair
Establish a Monitoring Project for In-Ground Nitrogen-Reducing Biofilters (INRB)
To protect, promote and improve the health of all people in Florida through integrated state, county, and community efforts.

Division of Disease Control and Health Protection

Spring BMAPs

- Pending
- Effective

The BMAP and PFA boundaries were downloaded from Florida Department of Environmental Protection GIS Data Portal (2/2018).
Nitrogen-Reducing Treatment System Options

Overall Goal of Nitrogen Removal: ≥65%

Nitrogen-reducing Aerobic Treatment Units
- Certified to meet National Sanitation Foundation (NSF) Standards 40 and 245
- Require operating permit (OP), maintenance entity (ME) and maintenance contract agreement (MCA)

Performance-based Treatment Systems
- Must be designed by Florida Professional Engineer
- Require OP, ME and MCA

In-ground Nitrogen-Reducing Biofilter (INRB) stacked under a conventional drainfield
- No engineer design should be needed unless lot conditions require
- No OP, ME or MCA needed
## Construction Permit Applications for Nitrogen-Reducing Systems by 04/06/2019

Construction Permit Applications for Nitrogen-Reducing OSTDSs (Including the In-ground Nitrogen-Reducing Biofilter)

Legend
- Red dot: In-ground Nitrogen-Reducing Biofilters
- Green dot: Nitrogen-Reducing OSTDS
- County Boundary

The map was made based on data from the Environmental Health Database by April 6, 2019
Need to Establish a Monitoring Project for INRB

1. Applications for INRB are accumulating.
2. There is interest by a variety of stakeholder groups in the performance of INRBs.
Goals of Monitoring Project

1. What is the INRB nitrogen-removal effectiveness in various installations?
2. Evaluate how reliably INRB can achieve the minimum 65% nitrogen-removal effectiveness goal.
3. Evaluate INRB’s phosphorous-removal effectiveness.
4. Evaluate the factors that may influence the nutrient-removal effectiveness.
5. Document system installation and maintenance effort and costs.
To protect, promote and improve the health of all people in Florida through integrated state, county, and community efforts.

Division of Disease Control and Health Protection

Septic Tank → Drainfield Area

- ≥18” Unsaturated Nitrification soil per 64E-6.009(7)(a)10.
- ≥12” Woodchips/64E-6.009(7)(a)11. Soil Mix Denitrification Media
- ≥6” Unsaturated slightly limited soil and ≥6” to seasonal high water table

Florida HEALTH
Plan to identify and select eight (8) INRBs to be installed in these BMAP areas. Ideally, the eight systems will be distributed across the entire spring BMAP areas.

Spring BMAPs
- Pending
- Effective

The BMAP and PFA boundaries were downloaded from Florida Department of Environmental Protection GIS Data Portal (2/2018).
To protect, promote and improve the health of all people in Florida through integrated state, county, and community efforts.

**Division of Disease Control and Health Protection**

---

**Septic Tank**

- Lysimters at Bottom of Stage 2 media
- Observation ports on Top of Stage 2 Media
- Observation ports on Top of Stage 1 Media

**Stage 2 Lignocellulosic Media Layer**

- Stage 1 Sandy Layer
- Drainfield Material
- Drainfield

**Lysimters at Bottom of Stage 1 Media**

Florida HEALTH
Monitoring Locations

1. Septic tank effluent.

2. Stage 1 media effluent (proximal, middle, and distal portions of the drainfield).

3. Stage 2 media effluent (proximal, middle, and distal portions of the drainfield).
Monitoring Chemical Parameters

1. Total Kjeldahl Nitrogen (TKN).
2. Ammonium.
4. Total Nitrogen.
5. Total Phosphorus.
7. Alkalinity (low priority).
8. Chloride (optional).
Monitoring Field Parameters

1. Water Temperature.
2. Dissolved Oxygen.
3. Specific Conductivity.
4. pH.
5. Oxidation-Reduction Potential.
System Survey

1. Elevation of Finished Grade.

2. Elevation of Infiltration Surface/Top of Stage 1 Media.

3. Elevation of Bottom of Stage 1 Media/Top of Stage 2 Media.
Document Weather Conditions for the Period of Monitoring

1. Antecedent 7-day, monthly and annual total rainfall.
2. Antecedent 7-day, monthly and annual average air temperature.
3. Antecedent 7-day, monthly and annual average evaporation rate.
Sampling Frequency and Duration

1. All systems will be sampled quarterly.

2. Each system will be sampled for eight consecutive quarters.
Document Drainfield and INRB Structure

1. Installation costs.
2. Drainfield size.
3. Drainfield type.
   - Trench or bed
   - Subsurface, fill, or mound
   - Gravity or pressure dosing
4. Stage 2 Lignocellulosic material size distribution
5. Stage 2 fine aggregate texture
Installation and Use of INRB

1. Overall system assessment.
2. Maintenance efforts and costs.
3. Household water use (maybe flow to drainfield if possible).
Evaluate INRB’s Nitrogen-Removal Effectiveness

1. Nitrogen-removal effectiveness will be estimated using the following equation:

\[ Nr = \frac{N_{\text{influent}} - N_{\text{effluent}}}{N_{\text{influent}}} \]

Where,

- \( N_r \) is nitrogen-removal effectiveness
- \( N_{\text{influent}} \) is the total nitrogen concentration in influent
- \( N_{\text{effluent}} \) is the total nitrogen concentration in effluent.
Evaluate INRB’s Nitrogen-Removal Effectiveness – Continued

Proposed method to assess system compliance with the design target (minimum 65% for installation *median* nitrogen-removal effectiveness, minimum 50% for *event samples*):

1. For each INRB installation, the median $N_r$ of the eight quarterly samples needs to be larger than 65%.

2. Among the eight INRBs monitored, median $N_r$ of at least six systems needs to be equal to or higher than 65%. This provides 90% confidence that the percent INRBs in compliance with the design target is significantly higher than 50%.
Evaluate INRB’s Nitrogen-Removal Effectiveness – Continued

3. When pooling individual event monitoring results from all eight INRB installations together, out of the total $64 N_r$, at least 54 should be equal to or higher than the minimum event target value. This will provide 90% confidence that the fraction of event results meeting the 50% nitrogen-removal target is significantly higher than 75%.

**Note:** Minimum target value for events is calculated as the average between nitrogen-removal effectiveness of a conventional system (35%) and the target of 65%.
Estimating Possible Lignocellulosic Decomposition

1. If subsidence of the system is observed, identify which drainfield layer causes the system subsidence:
   a) **Drainfield layer** (elevation difference between the finished grade and infiltration surface)
   b) **Stage 1 media layer** (elevation difference between the infiltration surface and the bottom of the Stage 1 media)
   c) **Stage 2 media layer** (elevation difference between the bottom of the Stage 1 media and bottom of the Stage 2 media).

2. If the subsidence is mainly caused by the change of 1 c), the change of the lignocellulosic media volume will be calculated and be used as an estimation of loss of lignocellulosic media.
Possible Factors Influencing the Nitrogen-Removal Effectiveness

1. Weather conditions (air temperature, rainfall, and evaporation).
2. Water table separation (piezometer measurements).
3. Dissolved oxygen concentration in the lignocellulosic layer.
5. Drainfield structure (size, type, and waster distribution).
To protect, promote and improve the health of all people in Florida through integrated state, county, and community efforts.

Division of Disease Control and Health Protection

Project Cost Estimate

1. Expected Project duration: Four years from late 2019 to late 2024.

2. Total project cost is about $300,000, covering:
   a) Monitoring equipment and installation.
   b) Supply purchase.
   c) Sample collection travel and staff time.
   d) Laboratory analyses of collected samples.
   e) Reports preparation.

3. Now applying for $180,000 319 grant support.

4. Require $120,000 DOH match (in-kind salary match and Onsite Sewage Research Fund).
Onsite Sewage Program Research Fund

3. Annual revenue:
   b) 2017-2018: $102,614.
   c) 2018-2019 (expected): $123,000.
Onsite Sewage Program Research Fund - Continued

4. Year-to-date net expenditure: $242
   a) Continued monitoring project is mostly funded by general onsite sewage program fund and 319 Grant.
   b) Florida Water Management Inventory is currently funded by several federal grants.

5. Balance by 4/8/2019: $310,022

6. Proposed expenditure on the INRB monitoring project: average $40,000/year for the first three years.
Updates on Proposed Legislation
Updates on the Florida Water Management Inventory (FLWMI) Project
Updates on the OSTDS Funding Investigation
Identified OSTDS Funding Sources

- Florida Springs Protection Fund.
- Septic Upgrade Incentive Program Fund.
- State Housing Initiative Program Fund.
- U.S. Environmental Protection Agency (EPA) Clean Water State Revolving Fund (CWSRF, a.k.a. SRF).
- EPA Nonpoint Source Section 319 Grants.
- U.S. Department of Agriculture, Rural Development Housing Program – Single Family Housing.
- U.S. Department of Housing and Urban Development through Florida Department of Economic Opportunity.
CWSRF funded decentralized systems in 24 of 50 states.
Funding Disbursement Approaches (from the perspective of an entity that provides funding)

- Direct lending
- Linked deposit
- Pass-through funding
Florida CWSRF

1. Primarily funded wastewater treatment plans and stormwater projects so far.
2. OSTDS funding not implemented but eligible.
3. Distributing CWSRF directly from DEP to homeowners not feasible because of the workload and DEP staffing.
4. DEP prefers the pass-through funding mechanism using local governments or third party entities as the funding management and distribution entities.
5. No county governments showed willingness to be the funding management and distribution entities.
OSP-Survey of EH-directors in 67 County Health Departments

1. Whether there are strong needs for financial assistance to support OSTDS repairs and modifications.
2. How OSTDS failures are addressed without sufficient funding support.
3. Whether there lenders available in local area to provide funding, and, if yes, who are they?
4. If no lenders are locally available, whether there are discussions of establishing local funding mechanisms.
5. What entities in local areas may be able to manage a loan fund from DEP and dispense money to homeowners.
6. What are major challenges for local jurisdictions to become or establish such entities.
1. Received 23 responses.
2. Represented 28 counties.
3. Accounted for 42% of 67 counties.
Results from the Survey

1. About 60% of the responses indicated strong needs of financial support for OSTDS management.
2. Available state and local funding for OSTDS is insufficient. Loan availability to OSTDS is also limited.
3. About 50% of the responses indicated that the State Housing Initiative Partnership (SHIP) program managed by county housing departments can be a potential candidate to function as CWSRF management and distribution entity.
4. DEP CWSRF program does not have any problem using SHIP as a vessel.
5. Florida Housing Finance Corporation – the SHIP program administrator.
Effort from Florida Onsite Wastewater Association (FOWA)

FOWA is working on a proposal to become a utility type of entity that manages OSTDS fund from DEP.
Next Steps for the Project

1. Wrap up the project.
2. Prepare a written summary of the findings.
3. Possibly: Prepare some education materials for county health departments, OSTDS industry, and homeowners:
   a) a written summary introducing the available funding sources for OSTDS.
   b) website links to various funding programs.
Updates on the Continued Monitoring
“Passive” Nitrogen Reduction Systems (PNRS)

Reduce effluent N using **reactive media** for denitrification and a **single liquid pump**, if necessary.

Wastewater from home

Stage 1
(nitrification)

nitrification media
sand & expanded clay

Stage 2
(denitrification)

denitrification media
lignocellulosic & elemental sulfur

Dispersal
In-Tank PNRS

In-Tank Two Stage Biofilter with Stage 1, Dual Media Stage 2 Lignocellulosic (2a) followed by Elemental Sulfur (2b).

Note: In flat landscapes may need up to a single pump.
In-Ground Passive Nitrogen System

Conventional OSTDS + In-Ground Two Stage System: Stage 1 Sand, and Stage 2 Lignocellulosic Materials

Ground Surface

Wastewater from Home

Septic Tank (Primary Treatment)

Pump Tank

Stage 1 & 2 Vertically Stacked Biofilter (Nitrification & Denitrification)
Nitrogen Reduction at Field Sites

Full Scale Concepts Complement Existing Septic Systems
Goals of the Monitoring Project

Goals

• Establish long-term performance of the two-stage passive nitrogen removal technology
• Provide guidance for possible system refinement and future implementation
• Monitor operation and maintenance requirements
EPA 319 Grant Support

1. The continued monitoring project is funded with $72,000 319 Grant fund and $48,000 DOH match. The grant agreement started in June 2018 and will end in September 2021.

2. The four systems will be sampled quarterly eight times.

3. Five sampling events have been completed.

4. All sampling events will be finished in 2019.
Continued Monitoring Time Line

3/2017 First Sampling Event
11/2017 Second Sampling Event
12/2017 319 Grant Approved by EPA
4/2018 Third Sampling Event
5/2018 Work Plan Approved by DEP

6/2018 Contract Agreement Signed with DEP
10/2018 QAPP(Task One Deliverable) Approved by DEP
11/2018 Fourth Sampling Event
2/2019 Fifth Sampling Event
3/2019 Task Two Deliverable Approved by DEP

QAPP: Quality Assurance Project Plan
Continued Monitoring Time Line - Continued

- 5/2019 Six Sampling Event
- 8/2019 Seventh Sampling Event
- 11/2019 Eighth Sampling Event
- Final Report before 9/2021
Samples were collected on 3/15/2017, 11/09/2017, and 4/19/2018 from:

a) BHS3-STE (Septic/Pump tank)
b) BHS3-LY01 (Bottom of stage 1 medium)
c) BHS3-LY01 (Bottom of stage 1 medium)
d) BHS3-LINER (Effluent from stage 2 medium)
