Indoors, radon can be found at higher levels.

Radon is found in commercial buildings, houses, schools, high rises, etc.

Radon is a colorless, odorless and tasteless gas that forms naturally in soil and rock throughout the world.

Outdoor levels are usually low.

In the U.S., radon is the leading cause of lung cancer among non-smokers.

**Protect yourself:**

All buildings and houses should be tested.

**Constructing a new house or building?** Look into radon-resistant techniques.

**Stop smoking.** If you are exposed to radon, smoking can increase lung cancer risk.

**YEARLY DEATHS:**

- Radon: 21,000
- Secondhand Smoke: 3,000
No radon level is safe.
A level at or above 4 pCi/L is considered high.

Radon level elevated?
Your next step is to reduce radon levels to safer limits.
