# Introduction

The Florida Department of Health is pleased to release the 2013 Florida Behavioral Risk Factor Surveillance System (BRFSS) State and County Data. This historic surveillance effort would not have been possible without the support of Florida's 67 County Health Departments (CHDs).

The Florida BRFSS has been collecting and reporting health behavior data since 1986. This statewide telephone survey is the only source of state-specific, population-based estimates of the prevalence of various health conditions and related risk behaviors among Florida residents aged 18 and older. The purpose of this survey is to gather information regarding personal health and risk behaviors, selected medical conditions, and preventive health care practices among Florida adults.

The 2013 BRFSS was the fourth county-level survey conducted. It was previously conducted in 2002, 2007, and 2010. The 2013 county-level survey was developed in collaboration with state and local representatives and better designed to meet the needs of CHD programs by offering options to add county developed questions and increase sample sizes.

Over 34,000 interviews were completed statewide in the 2013 calendar year, with a target sample size of 500 completed surveys in each county.

Taylor County had approximately 18,718 adult residents in 2013, based on Florida CHARTS, and 452 adults responded to the 2013 county-level BRFSS survey.

The 2013 BRFSS provides counties and the state with a rich data source to estimate the prevalence of personal health behaviors that contribute to morbidity and mortality among adults in Florida. The following data tables present the survey data on a variety of issues related to health status, health care access, lifestyle, chronic illnesses, and disease prevention practice.

Because BRFSS respondents are randomly selected, measures of prevalence and mean are subject to random sample errors. Each measure listed in the data tables includes the 95% confidence interval (CI). If the confidence intervals overlap, there is no statistically significant difference in the prevalence rates. However, if the confidence intervals do not overlap, there is a statistically significant difference. The significance of measures with very wide confidence intervals should be interpreted with caution. Measures of prevalence and mean are excluded from the tables for any subpopulation with a sample size less than 30, which would yield statistically unreliable estimates.

The prevalence rates are adjusted, or "weighted," by the Centers for Disease Control and Prevention (CDC) to represent all Florida adults. Weighting is a procedure that adjusts for the chance of an adult being selected to complete the survey and for discrepancies between the adults who completed the survey and the overall population of Florida adults. The data were weighted to the respondent's probability of selection by county, as well as age, sex, marital status, race/ethnicity, education level, and housing type.

Due to a change in weighting methodology and the inclusion of cellular telephone responses starting in 2011, data from 2013 may not be comparable to data collected before 2011.

If any assistance is needed with interpretation or survey methods, please contact the Bureau of Epidemiology at (850) 245-4401.
