Introduction

The Florida Department of Health is pleased to release 2017-2019 Florida Behavioral Risk Factor Surveillance System (BRFSS) county-level data. This surveillance effort would not have been possible without the support of Florida's 67 County Health Departments (CHDs).

The Florida BRFSS is a statewide telephone survey that has been collecting and reporting health behavior data since 1986. This survey is the only source of state-specific, population-based estimates of the prevalence of various health conditions and related risk behaviors among Florida residents aged 18 and older. The purpose of this survey is to gather information regarding personal health and risk behaviors, selected medical conditions and preventive health care practices among Florida adults. Beginning in 2007, the BRFSS has been providing counties with local-level data every three years to estimate the prevalence of personal health behaviors and chronic health conditions that contribute to morbidity and mortality.

County-level surveys were previously conducted in 2002, 2007, 2010, 2013 and 2016. In 2017, the Department began using a three-year rolling rate methodology to provide county-level data. Combining three years of data creates a larger sample size, which decreases data suppression and allows annual reporting of county estimates. Completed surveys from each of the 67 counties were combined across the 2017-2019 survey period in order to produce statistically valid county-level estimates. This new methodology was designed in collaboration with the CHDs to better meet programmatic needs for local-level data.

A total of 54,260 interviews were completed statewide during the 2017-2019 period. 1,505 adults in Orange County responded to the BRFSS across these three years.

This report presents survey data on a variety of issues including health status, health care access, lifestyle, chronic illnesses and disease prevention practices. Because BRFSS respondents are randomly selected, measures of prevalence and mean are subject to random sample errors. Measures listed in the data tables include the 95% confidence interval. If the confidence intervals overlap, there is no statistically significant difference in the prevalence rates. However, if the confidence intervals do not overlap, there is a statistically significant difference. The significance of measures with very wide confidence intervals should be interpreted with caution. Measures of prevalence and mean are excluded from the tables for any subpopulation with a sample size less than 30, which would yield statistically unreliable estimates.

The prevalence rates are weighted by the Centers for Disease Control and Prevention to represent all Florida adults. Weighting is a procedure that adjusts for the chance of an adult being selected to complete the survey and for discrepancies between the adults who completed the survey and the overall population of Florida adults. The data were weighted to the respondent's probability of selection by county, as well as age, sex, marital status, race/ethnicity and education level.
