Introduction

The Florida Department of Health is pleased to release the 2016 Florida Behavioral Risk Factor Surveillance System (BRFSS) state and county data. This surveillance effort would not have been possible without the support of Florida's 67 County Health Departments (CHDs).

The Florida BRFSS is a statewide telephone survey that has been collecting and reporting health behavior data since 1986. This survey is the only source of state-specific, population-based estimates of the prevalence of various health conditions and related risk behaviors among Florida residents aged 18 and older. The purpose of this survey is to gather information regarding personal health and risk behaviors, selected medical conditions, and preventive health care practices among Florida adults.

The 2016 BRFSS was the fifth county-level survey to be conducted in Florida. It was previously conducted in 2002, 2007, 2010, and 2013. The 2016 county-level survey was developed in collaboration with state and local representatives and better designed to meet the needs of CHD programs by offering options to add county developed questions and increase sample sizes. Almost 37,000 interviews were completed statewide during the 2016 calendar year, with a target sample size of 500 completed surveys in each county.

Martin County had 125,741 adult residents and 475 adults responded to the 2016 county-level BRFSS survey.

The 2016 BRFSS provides counties and the state with a rich data source to estimate the prevalence of personal health behaviors that contribute to morbidity and mortality among adults in Florida. This report presents the survey data on a variety of issues including health status, health care access, lifestyle, chronic illnesses, and disease prevention practice.

Because BRFSS respondents are randomly selected, measures of prevalence and mean are subject to random sample errors. Each measure listed in the data tables includes the 95% confidence interval. If the confidence intervals overlap, there is no statistically significant difference in the prevalence rates. However, if the confidence intervals do not overlap, there is a statistically significant difference. The significance of measures with very wide confidence intervals should be interpreted with caution. Measures of prevalence and mean are excluded from the tables for any subpopulation with a sample size less than 30, which would yield statistically unreliable estimates.

The prevalence rates are adjusted, or "weighted," by the Centers for Disease Control and Prevention to represent all Florida adults. Weighting is a procedure that adjusts for the chance of an adult being selected to complete the survey and for discrepancies between the adults who completed the survey and the overall population of Florida adults. The data were weighted to the respondent's probability of selection by county, as well as age, sex, marital status, race/ethnicity, and education level.

Due to a change in weighting methodology and the inclusion of cellular telephone responses starting in 2011, data from 2016 may not be comparable to data collected before 2011.

If any assistance is needed with interpretation or survey methods, please contact the Florida Department of Health, Public Health Research Section at (850) 245-4585.
