Florida 2011 PRAMS Surveillance Data

Included are a series of tables describing aggregated data on the findings from the 2011 Florida Pregnancy Risk Assessment Monitoring System (PRAMS), an ongoing population-based survey.

The intended audiences of this these data are staff of Florida Department of Health (DOH) Bureaus of Chronic Disease and Maternal and Child Health; Centers for Disease Control and Prevention (CDC) project officers and grant reviewers; County Health Departments, other agencies, and offices providing or developing maternal health initiatives. The data as provided in this data summary are not designed for use in epidemiologic studies.

The data tables contain detailed statistics on 162 maternal and child health indicators from the PRAMS questionnaire. The data are presented in three sections:

1. Maternal Health and Behaviors
2. Prenatal and Postpartum Care
3. Infant Health

These data provide state-level estimates about factors pertaining to maternal and child health. PRAMS survey data are adjusted, or “weighted,” so that the resulting estimates can be generalized to the state population of pregnancies that resulted in a live birth during the year (excluding those that resulted in pluralities of four or greater).

The tables and charts present major maternal and child health issues by race/ethnicity, maternal age, maternal education, household income, Medicaid recipient status, and marital status. In every table, state-level estimates derived from the 2011 Florida PRAMS survey datasets are provided so that comparisons may be made between two or more subpopulations within the demographic groups or between two or more variables.

The 2011 Florida PRAMS sample size of 2,337 represents 213,237 live births born to Florida residents during 2011. Of the 2,337 new mothers invited to participate in PRAMS, 1,392 completed the survey. The response rate was 61.6%.

Racial disparities are significant. Compared to other race/ethnicity, non-Hispanic blacks had the highest prevalence rates of pre-pregnancy obesity, physical abuse, unintended pregnancy, late diagnosis of pregnancy, high blood pressure during pregnancy, low birth weight and preterm births. Non-Hispanic blacks had the lowest prevalence rates of folic acid consumption, breastfeeding and laying infants down to sleep on their backs. Non-Hispanic whites had the highest prevalence rates of cigarette use and alcohol consumption during pregnancy.

The prevalence rates also vary significantly by age. Compared to older mothers, mothers less than 25 years old have higher prevalence rates of cigarette use, physical abuse, and unintended pregnancy. Mothers less than 19 years old have the highest prevalence rates of late diagnosis of pregnancy, late entry into prenatal care, labor pains, high blood

pressure, urinary tract infection, incompetent cervix, neonatal intensive care, and the laying infants down to sleep on side or stomach. Mothers 35 years old and older have highest prevalence rates of prenatal diabetes, cesarean section, preterm births and breastfeeding.

An overview of the Florida PRAMS project, the methods used in the analysis of the 2011 data and PRAMS 1993-2010 data summaries are available at:

Well-Baby Check Ups

PRAMS Question: Has your new baby had a well-baby checkup? Answer: Yes.

Prevalence (%) of infants in Florida having at least one well-baby checkup

MATERNAL DEMOGRAPHIC CHARACTERISTICS		PERCENTAGE	95% CI
ALL	Overall	97.9	96.7 – 98.6
RACE/ETHNICITY	Non-Hisp. White	98.1	96.2 – 99.1
	Non-Hisp. Black	98.5	94.9 – 99.6
	Hispanic	97.1	94.2 – 98.5
AGE GROUP	19 & Under	98.4	91.1 – 99.7
	20-24	96.8	93.4 – 98.5
	25-34	98.7	97.3 – 99.4
	35 & Older	96.0	90.7 – 98.3
EDUCATION LEVEL	<High School	94.7	89.3 – 97.4
	H.S.	97.3	94.6 – 98.7
	>High School	99.1	97.8 – 99.6
HOUSEHOLD INCOME	<\$15,000	97.9	95.6 – 99.0
	\$15,000-\$34,999	96.6	93.6 – 98.3
	\$35,000 or More	99.2	97.3 – 99.8
MEDICAID RECIPIENT	Yes	97.9	96.3 – 98.8
	No	97.8	95.6 – 98.9
MARITAL STATUS	Married	98.4	96.7 – 99.2
	Not Married	97.3	95.3 – 98.5

CI=Confidence Interval

Florida PRAMS Overview and Methods

The Pregnancy Risk Assessment Monitoring System (PRAMS) is a population-based surveillance system of maternal behaviors and experiences before and during a woman's pregnancy and during the early infancy of her baby. In 1987, the U.S. Centers for Disease Control and Prevention (CDC) developed the PRAMS project initially with five states. The decision to develop the PRAMS surveillance system was based on research which showed that the United States infant mortality rate was no longer declining as rapidly as it had in past years, the prevalence of low birthweight was showing little change, and maternal behaviors such as smoking, drug use, alcohol use, and limited use of prenatal and pediatric care were contributing to the slow rate of decline. The Florida PRAMS surveillance project was initiated in June 1993.

Purpose of PRAMS

The overall goal of PRAMS is to reduce infant morbidity and mortality by changing maternal behaviors both before and during pregnancy and during early infancy. PRAMS is designed to establish and maintain state-specific, population-based surveillance of selected maternal behaviors that occur before and during pregnancy and during early infancy and to generate state-specific data for planning and evaluating maternal and child health programs. PRAMS was designed to supplement data from vital records and to generate data for planning and assessing perinatal health programs in each participating state, as well as to allow comparisons among states.

Survey Protocol

Florida residents who gave birth to live-born infants within two to five months before the survey were randomly selected to participate in PRAMS. Florida's sampling strategy included four strata: 1) low birth weight among whites, 2) low birth weight among non-whites, 3) normal birth weight among whites, 5) normal birth weight among non-whites.

Methods

Data collection for Florida PRAMS is the result of joint efforts between CDC and DOH. PRAMS is a mail/telephone surveillance system that includes mailing surveys to selected respondents two to five months after they have given birth. Questionnaires are mailed to selected participants a maximum of three times. Participants who do not complete a mailed questionnaire are contacted by telephone. For 2011, the state-level Florida PRAMS had a response rate of 61.6%.

The weighted Florida PRAMS datasets are analyzed using SAS Version 9.3 and SUDAAN 10.0.1. The point estimates and 95% confidence intervals (95% CI) are calculated using the SUDAAN procedure, "PROC CROSSTAB". All missing and unknown response values are excluded from individual calculations where applicable. No statistic is provided if the unweighted sample size of the total number of respondents within a demographic level of response is less than 30.

Survey Estimates

PRAMS survey data are adjusted, or “weighted,” so that the resulting estimates can be generalized to the entire state population of pregnancies which resulted in a live birth during the year (excluding those that resulted in pluralities of four or greater). For PRAMS, we want to be able to infer behaviors among the entire group of women in Florida who delivered a live born baby within a specified period of calendar time and who were residents of Florida. This group of women forms the *population* of interest; the individual women who were randomly selected were known as a *sample* from this population.

Strengths and Limitations of the PRAMS

To use PRAMS correctly, users should be aware of the strengths and limitations of the data. The major strengths of PRAMS include:

1. It is a flexible and relatively inexpensive method of collecting public health data.
2. It is a population-based survey, allowing the data to be generalized to overall state-level populations.
3. The PRAMS survey has been conducted in a majority of states for many years. Thus, states can compare their data with each other, as well as analyze the data for trends over time.

However, PRAMS has limitations, including:

1. The data collected consists of self-reported information that has not been verified.
2. The survey has a limited number of completed interviews, and the sample size may be too small for analysis on some sub-populations.
3. The sample is restricted to: (a) include only one infant from pregnancies that resulted in twins or triplets; and (b) exclude infants from pregnancies that resulted in pluralities of four or greater. Because of these restrictions, estimates of low birth weight and preterm delivery are lower than the rates reported from the DOH Bureau of Vital Statistics. Population statistics for these birth outcomes can be obtained from Florida CHARTS (Community Health Assessment Resource Tool Set) at <http://www.floridacharts.com/charts/BirthQuery.aspx>.

Appendix - B

Survey Definitions

Medicaid Recipient - A woman was defined as a Medicaid recipient if she received Medicaid just before pregnancy, or if her prenatal care was paid by Medicaid, or if delivery was paid by Medicaid.

Mistimed pregnancy is defined as being wanted later.

Obesity is based on a Body Mass Index (BMI) of 30.0 or more. BMI is calculated as follows: weight (kg)/height (m)² or BMI = [weight (lb)/height (in)²] x 703).

Overweight is based on a Body Mass Index (BMI) between 25.0 and 29.9.

Unintended pregnancy is defined as either being wanted later or not being wanted then or at any time in the future.

Underweight is based on a Body Mass Index (BMI) of less than 18.5.

Unwanted pregnancy is defined as not being wanted then or at any time in the future.

Multiple Answers

Some Florida PRAMS 2011 survey questions allowed the respondent to choose multiple answers. In these cases, all response options were analyzed for this data table. The following Florida PRAMS survey questions fall under this category.

- During the month before you got pregnant with your new baby, were you covered by any of these insurance plans? Check all that apply.
- What were your reasons or your husband's or partner's reasons for not doing anything to keep from getting pregnant? Check all that apply.
- When you got pregnant with your new baby, what were you or your husband or partner using to keep from getting pregnant? Check all that apply.
- Did any of these health insurance plans help you pay for your prenatal care? Check all that apply.
- Did any of these health insurance plans help you pay for the delivery of your new baby? Check all that apply.
- What kind of birth control are you or your husband or partner using now to keep from getting pregnant? Check all that apply.

Appendix - C

Birth Certificate Variables and Definitions

While the majority of the information in this data was based on direct responses to the Florida PRAMS survey questionnaire, other variables, such as the maternal demographics, were acquired from the Florida Certificate of Live Birth Records portion of the PRAMS dataset, which reflected the following birth certificate text fields:

- Race – White, Black or African American, American Indian or Alaska Native, Asian Indian, Chinese, Japanese, Filipino, Korean, Vietnamese, Other Asian, Native Hawaiian, Guamanian or Chamorro, Samoan, Other Pacific Isl.
- Ethnicity – Hispanic or Haitian origin? (Specify No or Yes. If Yes, specify Mexican, Puerto Rican, Cuban, Central/South American, Haitian, Other Unknown Hispanic)
- Age – date of birth
- Education – (Specify only highest degree or level of school completed)
- Marital status – Is mother married?
- Preterm births/gestational age – Clinical estimate of gestation (Weeks)
- Birth weight – (Specify in grams only)
- Prenatal care – Month of pregnancy prenatal care began – First, second, third or no prenatal care
- Method of delivery (Check all that apply with an (X)): Vaginal, vaginal birth after previous C-section, primary C-section, repeat C-section, forceps, vacuum.
- Vaginal Delivery – The analysis of vaginal delivery among women in Florida includes all vaginal deliveries: unassisted, assisted, and after a previous C-section
- Delivery by C-section – The analysis of c-section delivery among women in Florida includes all C-sections: primary or repeat.

Appendix - D

Interpreting the Data from the 2011 Florida PRAMS Data

As noted in Appendix A, a prevalence or percentage from the PRAMS survey is an estimate of the real population prevalence. When a percentage is derived from a sample rather than a census of a population, sampling errors occur. Because sampling errors are inherent in these types of surveys, we calculate 95% confidence intervals (CI) for each prevalence estimate to determine the accuracy of that estimate. Simply, a 95% confidence interval is the range in which the real population prevalence is likely to be found 95% of the time. Further, the smaller the confidence interval, the more accurate the estimated prevalence. For example, the table below shows that 8.6% of new moms in Florida reported cigarette smoking during the last three months of their pregnancy. The confidence interval is 6.8% to 10.4% (6.8 – 10.4), suggesting that the real population prevalence is very likely to be within the narrow range and close to the estimate of 8.6%.

Maternal Demographic	Measure	95% CI
Overall	8.6	6.8 ~ 10.4
Race/Ethnicity		
Non-Hispanic whites	14.3	11.1 ~ 17.6
Non-Hispanic blacks	3.9	0.7 ~ 7.1
Hispanics	2.6	0.8 ~ 4.4

The confidence intervals are determined by many factors, in particular the sample size. Compare the confidence intervals for non-Hispanic whites, non-Hispanic blacks, and Hispanics in the table above. As we divide the data for analysis by race/ethnicity, age, etc., the sample size for each group becomes smaller, the confidence intervals become larger, and the estimates become less reliable.

In addition to estimating the accuracy of the prevalence estimates, the confidence intervals are used to compare populations. As a rule, the difference in prevalence between two populations is statistically significant if the confidence intervals of the two population estimates do not overlap. From the above example, we can see that the confidence interval for non-Hispanic whites (11.1 – 17.6) and the confidence interval for non-Hispanic blacks (0.7 – 7.1) do not overlap. We can thus conclude that there is a significant difference in the prevalence of cigarette smoking during pregnancy between non-Hispanic whites and non-Hispanic blacks and that the prevalence of this behavior among non-Hispanic whites is higher than among non-Hispanic blacks.

Comparisons of confidence intervals are not a true test of statistical significance, however, and it is possible for the difference between two estimates to be statistically significant even when the confidence intervals overlap. While it is beyond the scope of this data to test for whether the difference between these two estimates are actually statistically significant, data users may contact the PRAMS Project Coordinator or Data Analyst for technical assistance.

Appendix - E

The Florida PRAMS 2011 Survey Sample

Survey respondents' demographics by race/ethnicity (unweighted numbers, weighted numbers, and weighted percentages), Florida PRAMS 2011*

Maternal Demographic	Statewide		
	Frequency (completed survey)	Weighted Number	Weighted Percent
Totals	1392	209822	100
Race/Ethnicity			
non-Hispanic whites	622	98387	47.5
non-Hispanic blacks	287	38074	18.4
Hispanics	392	59140	28.6
All Others*	78	11313	5.5
Age Distribution			
19 Years and Under	112	17842	8.6
20 to 24 Years	341	50925	24.4
25 to 34 Years	717	111394	53.4
35 Years and Over	222	28329	13.6
Education			
Less Than 12 Years	224	32733	15.8
12 Years	408	64815	31.2
13 Years or More	753	110100	53.0
Annual Household Income			
<\$15,000	489	69270	35.3
\$15,000 to \$34,999	371	59721	30.4
\$35,000 or more	453	67364	34.3
Medicaid Recipient Status			
Medicaid Recipient: Yes	851	126049	60.8
Medicaid Recipient: No	533	81382	39.2
Marital Status			
Married: Yes	716	105078	50.4
Married: No	676	103411	49.6

*Due to small sample size and non-homogeneous characteristics, statistical results from the individual analysis of the race/ethnicity category of "All Others" is excluded from this document. However, this group is included in all other calculations.
