--------	-------------------------	----------------	------------------	---

NOTE: Clinical trial data indicate that Dovato (dolutegravir/lamivudine) is an option for Test and Treat use for newly diagnosed persons with HIV. Department of Health and Human Services guidelines only recommend Dovato if HIV RNA is <500,000 copies/mL, patient does not have coinfection with hepatitis B virus, and resistance testing results show no resistance to lamivudine. Dovato is available through samples or via the manufacturer's patient assistance program.
