Point-Prevalence Screening for CPOs

What is a point-prevalence screening (PPS)?

A PPS is a surveillance method that involves swabbing the rectum to test for carbapenemase-producing organisms (CPO). A PPS is performed after a patient/resident within a facility is identified as being colonized or infected with a CPO to determine if other patients/residents are colonized.

Who should be screened?

The extent of screening is dependent on several factors including, but not limited to, the organism, length of contact precautions, and use of shared spaces. Best practice is to aim for a 100% collection rate to ensure silent acquisition is not occurring in the facility. The Health Care-Associated Infection (HAI) Prevention Program can help you determine who should be screened.

Do patients/residents need to provide consent?

Yes. As with other laboratory specimens, all patients/residents will need to provide consent or assent. Please note that this is a public health response to a serious infection and public health concern, not a research study. Per the Centers for Medicare and Medicaid Services, verbal consent is required for this type of response. The HAI Prevention Program can provide you with a template consent form and script if your policies require written consent.

How are PPS specimens collected?

CPOs are carried in the gut in and in stool. You will need to designate a staff member or resource to collect the specimens. The Antibiotic Resistance Laboratory Network (ARLN) in Tennessee will provide cotton tip swabs, shipping containers, and free FedEx shipping for rectal specimen collection.

How long will it take to receive results?

You will receive preliminary laboratory results within 2-10 days after screening. The HAI Prevention Program will send you an encrypted email with the final results.

What should I do if a positive result is identified?

Place the patient/resident in a single room. If a single room is not available, cohort patients/residents with the same multidrug-resistant organism. Place the patient/resident on contact or enhanced barrier precautions (depending on the situation) and notify and train their clinical care team, including housekeepers, on the containment of this organism.

How many PPS rounds will be conducted?

Initially, one PPS will be conducted. If the initial PPS identifies additional cases, then PPS rounds will typically be conducted bi-weekly until two consecutive rounds of PPS have resulted in no new positives. If there was extensive transmission, two additional monthly PPS will be conducted to ensure organism transmission was halted.
