

# Florida Pregnancy Risk Assessment Monitoring System (PRAMS) 2012 Surveillance Data Book

Published in October 2015

Rick Scott
Governor

John H. Armstrong, MD, FACS Surgeon General and Secretary

# Introduction

The Florida Department of Health (Department) is pleased to release the following series of tables and charts describing aggregated data from the 2012 Florida Pregnancy Risk Assessment Monitoring System (PRAMS), an ongoing population-based survey.

The 2012 Florida PRAMS sample size of 2,123 represents 212,954 live births born to Florida residents during 2012. Of the 2,123 new mothers invited to participate in PRAMS, 1,137 completed the survey. The response rate was 53%.

The intended audience for this data book includes Department staff at the State Health Office and County Health Departments; Centers for Disease Control and Prevention (CDC) project officers and grant reviewers; Healthy Start Coalitions; and other agencies or community researchers providing or developing maternal health initiatives.

The data tables contain detailed statistics on 87 maternal and child health indicators from PRAMS. The data are presented in three sections:

- 1. Before Pregnancy
- 2. During Pregnancy
- 3. Postpartum and Infant Health

These data provide state-level estimates of factors pertaining to maternal and child health. PRAMS survey data are adjusted, or "weighted," by CDC so that the resulting estimates can be generalized to the state population of women who had a live birth during the year (excluding those that resulted in pluralities of four or greater).

The tables and charts present maternal and child health issues by race/ethnicity, maternal age, maternal education, annual household income, maternal Medicaid recipient status, and maternal marital status to allow for comparison between two or more subpopulations within the same demographic group. Please note that due to 2012 being the first year to use the Phase VII questionnaire, the calculation of Medicaid recipient status and income levels in this data book have changed slightly. Comparisons between 2012 and previous years in these subpopulations may not be accurate.

Information about interpretation of this data book is provided in Appendix D. An overview of the Florida PRAMS project, the methods used in the analysis of the 2012 data, PRAMS 1993-2011 data summaries, and a PRAMS 2000-2010 trend analysis are available at <a href="https://www.floridaprams.org">www.floridaprams.org</a>.

If any assistance is needed with interpretation or survey methods, please contact the Bureau of Chronic Disease Prevention at (850) 245-4330.

# **Summary Table**

SELECTED INDICATORS	PERCENTAGE %
Before Pregnancy	
New moms in Florida who had dental cleanings before pregnancy	43.1
New moms in Florida who were uninsured before pregnancy	31.1
New moms in Florida who were overweight before pregnancy	22.9
New moms in Florida who were obese before pregnancy	18.4
New moms in Florida who took a vitamin containing folic acid before pregnancy	37.4
New moms in Florida diagnosed with Type 1 or Type 2 diabetes before pregnancy	2.0
New moms in Florida diagnosed with high blood pressure (hypertension) before pregnancy	5.1
New moms in Florida who had anemia (low iron) during the three months before pregnancy	14.6
New moms in Florida who had thyroid problems during the three months before pregnancy	5.4
New moms in Florida diagnosed with depression before pregnancy	6.6
New moms in Florida who had a previous live birth	57.2
New moms in Florida who had a low birth weight infant before having current baby	11.8
New moms in Florida who smoked cigarettes during the three months before pregnancy	18.9
New moms in Florida who drank alcohol during the three months before pregnancy	54.5
New moms in Florida with unintended pregnancies	45.0
New moms in Florida who did not use birth control at time of conception among those moms not trying to become pregnant	51.5
During Pregnancy	
New moms in Florida who participated in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) during pregnancy	d 56.5
New moms in Florida who had an HIV test during pregnancy	86.3
New moms in Florida who received a flu shot in the 12 months before giving birth	26.0
New moms in Florida who received a Tdap vaccination during pregnancy	27.8
New moms in Florida who had her teeth cleaned during pregnancy	35.5
New moms in Florida who were physically abused by a husband or partner during pregnancy	3.0
New moms in Florida who smoked cigarettes during the last three months of pregnancy	7.8
New moms in Florida who quit smoking around the time of pregnancy among those moms who smoked before pregnancy	e 60.1
New moms in Florida who drank alcohol during the last three months of pregnancy	10.5
New moms in Florida who experienced at least one stressor during the 12 months before giving birth	76.0
New moms in Florida who did not have prenatal care (PNC) during the first trimester of pregnancy	18.2
New moms in Florida who did not have health insurance to pay for prenatal care	7.0
New moms in Florida who experienced high blood pressure (hypertension) during pregnancy	14.2
New moms in Florida who were injured in an automobile accident during pregnancy	1.9
New moms in Florida who had gestational diabetes during pregnancy	9.2
New moms in Florida who had depression during pregnancy	6.1
New moms in Florida who had a cesarean section (C-section) delivery	35.3
Postpartum Care and Infant Health	
New moms in Florida using postpartum birth control	78.4
New moms in Florida who smoked cigarettes after delivery	12.6
New moms in Florida who had a low birth weight (LBW) infant	7.9
New moms in Florida who had a very low birth weight (VLBW) infant	1.6
New moms in Florida who had a preterm birth infant	9.6
New moms in Florida who had an infant admitted into a neonatal intensive care unit (NICU)	14.5
New moms in Florida who breastfed her new baby for at least three months	52.7
New moms in Florida who placed her infant on their back to sleep	64.8

#### Florida PRAMS Overview

The Pregnancy Risk Assessment Monitoring System (PRAMS) is a random population-based surveillance system of maternal behaviors and experiences before, during, and shortly after pregnancy. The Centers for Disease Control and Prevention (CDC) and the Florida Department of Health (Department) initiated the PRAMS project for Florida in 1993 in response to research indicating the infant mortality rate was no longer declining as rapidly as it had been in the U.S. Data collected by Florida PRAMS include information on maternal health and behaviors, prenatal and postpartum care, and infant health.

#### **Purpose of PRAMS**

The overall goal of PRAMS is to reduce infant morbidity and mortality by changing maternal behaviors before, during, and shortly after pregnancy. PRAMS was designed to establish and maintain state-specific, population-based surveillance of selected maternal behaviors and to generate state-specific data for planning and evaluating maternal and child health programs. PRAMS data are used to supplement state data from vital records and to develop and assess programs and policies for women and children to help reduce infant morbidity and mortality by changing maternal behaviors during pregnancy and during the child's early infancy.

# **Study Protocol**

A complex sampling strategy has been designed to draw random samples from all live births from the Florida birth certificate database. PRAMS excluded stillbirth fetal deaths and induced abortion because reporting systems for these outcomes are not routinely available and standard definitions for these outcomes vary widely. Each month, Florida PRAMS randomly selects approximately 200 new mothers who have given birth to a live-born infant to receive the survey. Florida's sampling strategy includes four strata: 1) white mothers who had a low birth weight infant, 2) non-white mothers who had a low birth weight infant, 3) white mothers who had a normal birth weight infant.

#### **Methods**

Data collection for Florida PRAMS is the result of joint efforts between the CDC and the Department's Bureaus of Family Health Services, Chronic Disease Prevention, and Vital Statistics. PRAMS is primarily a mail surveillance project with telephone follow-up of nonresponders. English or Spanish surveys are mailed to new mothers two to five months after giving birth. If there is no response to multiple mailed surveys, mothers are contacted by telephone. For 2012, Florida PRAMS had a response rate of 53%.

The weighted Florida PRAMS datasets are analyzed using SAS Version 9.3 and SUDAAN 10.0.1. The point estimates and 95% confidence intervals (95% CI) are calculated using the SUDAAN procedure, "PROC CROSSTAB." All missing and unknown response values are excluded from individual calculations where applicable. No statistic is provided if the unweighted sample size of the total number of respondents within a demographic level of response is less than 30.

# **Survey Estimates**

The PRAMS survey data are adjusted, or "weighted," so that the resulting estimates can be generalized to the entire state population of pregnancies which resulted in a live birth during the year (excluding those that resulted in pluralities of four or greater). The results of the PRAMS survey infer behaviors among the entire group of women in Florida who delivered a live-born infant within a specified time period and who were residents of Florida.

# **Strengths and Limitations of PRAMS**

To use PRAMS correctly, users should be aware of the strengths and limitations of the data. The major strengths of PRAMS include:

- 1) It is a flexible and relatively inexpensive method of collecting public health data.
- 2) It is a population-based survey, allowing the data to be generalized to overall state-level populations.
- 3) The PRAMS survey has been conducted in a majority of states for many years. Thus, states can compare their data with each other, as well as analyze the data for trends over time.

However, PRAMS has limitations, including:

- 1) The data collected consist of self-reported information that has not been verified. Therefore, results may be subject to recall bias.
- 2) The survey has a limited number of completed interviews and the sample size may be too small for analysis in some sub-populations.
- 3) The sample is restricted to: (a) include only one infant from pregnancies that resulted in twins or triplets, and (b) exclude infants from pregnancies that resulted in pluralities of four or greater. Due to these restrictions, estimates of low birth weight and preterm delivery are lower than the rates reported from the Department's Bureau of Vital Statistics. Population statistics for these birth outcomes can be obtained from Florida CHARTS at www.floridacharts.com.

# Appendix – B

# **Survey Definitions**

<u>Medicaid Recipient</u> – A mother who received Medicaid just before pregnancy or had her prenatal care paid for by Medicaid. Please note that in years prior to 2012, a Medicaid recipient was defined as a mother who received Medicaid just before pregnancy, had her prenatal care paid for by Medicaid, or had her delivery paid for by Medicaid. In 2012, the PRAMS Phase VII questionnaire does not ask what type of health insurance paid for delivery.

<u>Mistimed Pregnancy</u> – A pregnancy that the mother wanted to occur later.

Obesity – A mother who had a Body Mass Index (BMI) of 30.0 or greater. BMI is calculated as weight (kg)/height (m)<sup>2</sup> or [weight (lb)/height (in)<sup>2</sup>] x 703.

Overweight – A mother who had a BMI between 25.0 and 29.9.

Underweight – A mother who had a BMI of less than 18.5.

<u>Unintended Pregnancy</u> – A pregnancy that the mother wanted to occur later or did not want then or at any time in the future.

<u>Unwanted Pregnancy</u> – A pregnancy that the mother did not want then or at any time in the future.

#### **Birth Certificate Variables**

While the majority of information in these data tables was based on direct responses to the Florida PRAMS survey questionnaire, the following variables were acquired from the Florida Certificate of Live Birth Records portion of the PRAMS dataset: race, ethnicity, age, education, marital status, clinical estimate of gestation (used to determine preterm births), birth weight, and BMI.

# Appendix - C

#### **Stress-Related Questions**

Mothers were asked to answer whether or not the following events happened during the 12 months before their new baby was born:

- A close family member was very sick and had to go into the hospital
- I got separated or divorced from my husband or partner
- I moved to a new address
- I was homeless or had to sleep outside, in a car, or in a shelter
- My husband or partner lost his job
- I lost my job even though I wanted to go on working
- My husband, partner, or I had a cut in work hours or pay
- I was apart from my husband or partner due to military deployment or extended workrelated travel
- I argued with my husband or partner more than usual
- My husband or partner said he didn't want me to be pregnant
- I had problems paying the rent, mortgage, or other bills
- My husband, partner, or I went to jail
- Someone very close to me had a problem with drinking or drugs
- Someone very close to me died

Page 49 of this report has the prevalence of mothers who answered yes to any of the above stress-related questions.

# Interpreting the Data from the 2012 Florida PRAMS Data Book

A prevalence or percentage from the PRAMS survey is an estimate of the real population prevalence. Florida mothers who delivered a live-born baby within a specified period of calendar time is the population of interest; the individual women who were randomly selected are a sample from this population. When a percentage is derived from a sample rather than a census of a population, sampling errors occur. As sampling errors are inherent in these types of surveys, we calculate 95% confidence intervals (CI) for each prevalence estimate to determine the accuracy of that estimate. The smaller the CI, the more accurate the estimated prevalence. For example, the table below shows that 7.8% of new mothers in Florida reported smoking cigarettes during the last three months of pregnancy. The CI is 6.1% to 9.9% (6.1 - 9.9), suggesting that the real population prevalence is very likely to be within the range of 6.1% to 9.9% and close to the estimate of 7.8%.

MATERNAL DEMOGRAPHIC CHARACTERISTICS	2012 MEASURE %	2012 95% CI
Overall	7.8	6.1 - 9.9
RACE/ETHNICITY		
Non-Hisp. White	13.0	9.8 - 16.9
Non-Hisp. Black	7.0	3.6 - 13.3
Hispanic	1.0	0.3 - 3.3

The CIs are determined by many factors, sample size in particular. As the data are divided for analysis by race/ethnicity, age, etc., the sample size for each group becomes smaller, the CIs become larger, and the estimates become less reliable.

In addition to estimating the accuracy of the prevalence estimates, the CIs are used to compare populations. The difference in prevalence between two populations is statistically significant if the CIs of the two population estimates do not overlap. From the above example, the CI for non-Hispanic whites (9.8 - 16.9) and the CI for Hispanics (0.3 - 3.3) do not overlap. We can thus conclude that there is a significant difference in the prevalence of smoking cigarettes during the last three months of pregnancy between non-Hispanic whites and Hispanics and that the prevalence of this behavior is higher among non-Hispanic whites than among Hispanics.

Comparisons of CIs are not a true test of statistical significance, however, and it is possible for the difference between two estimates to be statistically significant even when CIs overlap. While it is beyond the scope of these data tables to test whether the difference between two estimates are actually statistically significant, data users may contact the PRAMS Coordinator or Data Analyst for technical assistance.
