UNTREATED SYPHILIS DURING PREGNANCY CAN BE FATAL, BUT IT DOESN'T HAVE TO BE.

Get tested. Get treated.

Congenital syphilis occurs when the sexually transmitted infection is passed on to her baby during pregnancy or delivery. If left untreated, it can cause serious harm to a baby, including death.

PROTECT YOUR BABY

GET TESTED Free STI testing can be done at a local county health department. All pregnant women should be tested for syphilis. Many people with syphilis do not have any symptoms.

GET TREATMENT A simple dose of antibiotics for mom and baby can treat and cure you both of the infection. This can be done while you're pregnant and prevent major complications.
